2112. SB-102 Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-23 14:39:12 UTC
From: sslavsky@acq.osd.mil
Message-ID: <6512391023031995.A15632.BETA.1193BAA70C00*@MHS>
Source record: 219492

I need some help with a problem that has developed on my vintage Heath SB-102. While the rig has always needed several minutes to warm up, it now takes at least 30 - 45 minutes to where I can receive at full strength and transmit at full power. Before that time, signals are attenuated and I have very low power output. If I tap on the LMO box with a screwdriver handle it will be OK for a few minutes and then drop out again. After full warm up it is generally OK, but still may drop out on occasion and can be reset by tapping. The panel meter seems to be indicating very low also when in S meter mode (I do get about 120 - 130 watts out and make contacts, so I know it works). I replaced the trimmer resistor which controls it, but that doesn't seem to help much. I have looked in the LMO, but can't find any loose connections or other obvious problems.
Any suggestions (other than buy a modern rig, however, if someone would love to buy this oldie, complete with power supply, mobile bracket and manuals, let me know) or anyone else have this happen? Thanks for any input

73,

Steve, N4EUK

2113. How to install all 5 band modules in your 736...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-23 15:03:48 UTC
From: jwhite@materials.com
Message-ID: <3ks2kk$481@lucy.infi.net>
Source record: 219493

The following is from an eMail message I composed in response to the question, "How can I install a 5th module in my Yeasu 736-R ?". I thought this information would be of general interest:

Well... It's not so tough to accomplish this task of adding the extra module to the 736. Yeasu has made the task relatively easy. At least from an electrical point of view. The modules are logically sensed. What this means is that they are basically all connected in parallel. They each respond to their own "query code". So, I would suggest the following...

Remove one of the modules from your radio. Note there are two plugs that connect the module to the circuit boards in the radio. The theory is very simple. You will manufacture a "Y" cable for each of these two plugs. The single end of the "Y" will plug into the circuit board in your 736. The other two ends will be used to connect to the corresponding cables on the modules. Now, you will have to locate a supplier of the male and female plugs which match these plugs. Alternately, you can elect to replace these plugs with more common ones. This will work just fine. You already have two sets of the correct connectors which you can cut off from the modules and use. The only drawback to this approach is it will void any remaining warranty on the unit/radio, and may make make it less desirable as a resale unit. Anyway, whether or not you elect to buy the matching connectors, or replace them with others, you must manufacture "Y" cables with a sufficient length to reach out of the radio to a place where you will position the "outboard" band modules. Once these cables are manufactured, you will need to make an exclosure which will allow the modules to be secured so they are in direct thermal contact with a sufficiently large heat sink to keep them cool during operation. To connect everything up, route the single end of the "Y" cable through the "antenna hole" and plug it into the proper connector on the 736's circuit boards. Then, plug up the two modules to the the other connectors and you're set. The 736 will act just like there were 5 modules installed inside. The memories, VFO's, everything will work.

I should say, you should be very, very careful making the connections from the connectors. Chances are if you cross a wire you will fry the radio and/or the band module. This is a mod and all risk are yours. But, it should work just fine if you are careful. I have spoken to Yeasu and they will confirm the theory if you want to talk to their tech people.

2114. Re: TNC schematics?

Newsgroup: rec.radio.amateur.equipment

I'm emailing you a schematic of a modem that can support almost any baud
rate with appropriate component changes (a couple of capacitors and/or
resistors). The BAYCOM SOFTWARE will not support such baud rates but
this modem will.

From: rlevenbe@adobe.com
Message-ID: <1995Mar23.170105.7875@adobe.com>
Source record: 219396

I have had a TH-79AD for about 2.5 months now and at the same time I bought a TH28A for my wife. They have both worked flawlessly and I am very happy with them. I have never had a use for the D feature of being able to lock out memory while scanning but it is there anyway. I made my choice by going in and holding the radios (Yaesu FT-530, FT-51R, Kenwood TH-79A and TH-78A and I just liked the feel of the Kenwood's better. I had heard that if you were dealing with the big boys (Kenwood, Yeasu, Standard, etc.) you pretty much getting the same quality across the board.

One night in a blackout I wished I had a backlit keypad like the Yaesu but now I am used to the feel of the keypad and can hit the keys blind.

Hope this helps in your decision making. I would definitely go somewhere local and look and feel the radios before making a purchase. Go somewhere big though, my local ham shop only sells Yaesu.

This seems to be the most appropriate group in which to post this. (Would it be more appropriate for another group? :-I)

I'm working on installing a 2 m mobile rig in a 1986 Ford Crown Victoria and am having trouble finding a hole in the firewall through which to run the power leads to the battery. Has anyone done this on an '86 Crown Vic? Hopefully I don't have to be mister "tough-guy" and start punching holes (shiver) in the firewall. I WAS able to find a route for the power leads in my '87 Tempo just fine, but the Crown Vic is another story. All advice appreciated.

>I want to do packet.
>I want to be able to communicate as far as I can by using phone (voice).

Far is determined by antenna height. A good antenna is secondly
important, a Ringo Ranger is one of the best. Wattage is the least factor.
As an example, I've worked the MIR space station (packet) on 5w HT when it
was 280 miles overhead. I've noticed that a lot of hams won't settle for
less than 50 watts though. A good cheap HT is the HTX-202. You can get
that for $100-$150 used. I don't know much about the 50w mobiles.

2120. HTX-212 specifications

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-23 18:43:03 UTC
From: sprouse@n3igw.PGH.PA.US
Message-ID: <21@n3igw.PGH.PA.US>
Source record: 219400

A friend had a dealer FAX him the specification pages from the manual.
The FAX was a little fuzzy so any misinformation or typos are my fault.
He also says the unit has 31 memory channels, both encode and decode
for CTCSS as well as the normal DTMF. It lists for $349 which means
you could get it from Marymac for about $297. Not a bad deal.

Anyone out there have one of these? Heard anything about them? Know
who actually makes the rig? I am giving real hard serious thought
to buying one. I also saw mention here on the net that the Shack was
planning a dual bander. Any truth to that one? Here are the specs. . .

Radio Shack Model HTX-212 2-meter mobile transceiver

SPECIFICATIONS

General

Frequency Range (factory)
Transmit.....144.600 - 148 MHz
Receive.....136.000 - 174.000 MHz
Frequency Step..... 5/10/12.5//20/25/50/100 hHz
Frequency Stability.....+/-10 ppm
Antenna Impedance.....50 Ohms
Speaker.....8 Ohms
Microphone.....Electret Condenser (1.2 kOhms)
Operating Temperature.....-22 to 140 F(-30 to 60C)
Dimensions (HWD)......1 3/8 x 5 9/16 x 6 9/16 Inches
(42x142x160mm)
Supply voltage.....13.8V DC (+/-15%)

Receiver

Intermediate Frequency
1st IF.....21.4MHz
2nd IF.....455 MHz
Sensivity
12 dBsinad.....0.25 uV
20 dBsinad.....0.39 uV
Squelch Sensitivity
Threshhold.....0.1 uV
Tight.....10dB above threshhold
Spurious Response Attenuation.....Better than 60 dB
Adjacent Channel Rejection.....Better than 60 dB
Modulation Acceptance Bandwidth.....Better than 7.5 kHz
Hum and Noise.....Better than 10dB

Audio Output Power at 10% THD.....Better than 2.0W
Audio Distortion.....2%
Audio Responce.....-6dB
Stand-by Current.....0.1mA
CTCSS Sensitivity.....0.15 uV
DTMF Squelch Sensitivity.....0.2 uV

Transmitter

RF Power Output.....45 W(high)/10 W(low)
Maximum Deviation.....5 kHz
Hum and Noise.....Better than 35 dB
Audio Distortion.....3%(TX)
Spurious and Harmonic Emmissions.....Better than 60 dB
Frequency Error.....+/-10 ppm
Microphone Sensitivity.....4 mV rms
CTCSS Tone Deviation.....0.75 kHz
DTMF Tone Deviation.....3.5 kHz
Curren Drain.....Less than 9 A at 45 W
Less than 7 A at 10 W

Specifications are typical; individual units might vary. Specifications are subjectd to change and improvement without notice.

It has DTMF squelch of several digits. But you have to expect a certain
sequence to be of any good. Don't think what you want is possible
without somekind of surgery and external circuitry. Might as well
build a external DTMF receiver box.

From: a-rickf@aladdin.tandem.com
Message-ID: <D5x7Gt.6BJ@ac.tandem.com>
Source record: 219413

Is this a pipe dream, or are there really good units out there that allow keypad entry of the frequencies for a mobile radio? I've heard the Alinco DR-600 and Yaesu FT-2700 do, but would like to hear from someone who owns one (or any other that allows direct entry).

I've been spoiled with the features available on the Yaesu 530 I've been carrying around, and I'd like something a little more convenient for the truck. Cost is important, but I'd rather wait until I have more money than settle for something I'd tire of in a month or so.

Looking for (at minimum) CTCSS encode, Direct keypad entry of frequency (to store in memories and use in VFO), Prefer decent/excellent performance in a noisy area (minimum intermod problems) and a lot of memories to store all those repeaters I never get much time to talk on... "Expanded receive" is a plus, but I don't care at all about 800 Mhz (why do so many people seem infatuated with trying to listen to cellular phones?). Definitely has to be dual band (though three band might be ok, if it were priced right).

Anyone care to comment on their experience with this kind of radio?

All information appreciated. I'd hate to have to post a nearly new radio in rec.radio.swap in a few months because I bought the wrong one due to lack of information.

Thanks - Rick KD6QZD

The conventional wisdom on this is that the Japanese were able to
recoup their non-recurring engineering costs on their domestic
market, which was 5 times as large as that of the US due to the
existence there of a no-code HF license. From that the inference
is fairly direct that the amateur market becomes bigger and more
lucrative with reduced licensing requirements. And the converse,
that more stringent licensing requirements reduces demand for
amateur equipment, appears to hold also. Equipment manufacturers
that could not penetrate the Japanese market - and that included
generally all US manufacturers - were at a severe disadvantage.
This was true not only in amateur radio, but also in electronics
generally.

You will need to drill the hole!! After installing police radios in many Crown Vics its the best way.

If you still do not want to do this you can take the easy way out and go to the fuse block and with a fuse-to-spade lug adapter grab the hot side of the fuse and attaching your own fused cord. Make sure you have a good ground for the negative lead or the radio will pull the negative through your antenna. If the mount is one that is drilled (NMO roof) the metal will decay and rust!!

2136. Cross-band repeat for IC281H..

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-24 03:53:06 UTC
From: WALLY@ukcc.uky.edu
Message-ID: <1736A141D2S86.WALLY@ukcc.uky.edu>
Source record: 219418

I've looked on oak.oakland.edu and I haven't seen anything on the Icom 281H, so here goes.

Is it possible to do cross-band repeat with this radio? For the obvious reason, listen on 440 and transmit into a repeater, and I listen to the repeater output and transmit 440 into the mobile..

I've looked around in the manual, tried to get something to work from the full-duplex mode hoping it would work, but it only works while you're holding PTT unless I'm mistaken.. If so, let me know how to get it to work.. :)

Also, the front end on this radio "feels" like it's wide open, it gets PLENTY of intermod, so while I have a scanner front end, I might as well use it as a scanner as well... Does anyone have the way to open the receive?

Thanks..

I have a Kenwood 2600A handheld. I want to use it with a repeater that requires a 88.5 Hz tone. Can anyone help me?

I have heard a rumor that these radios can be set to generate a single subaudible tone, even without the optional tone board. The user's manual says nothing about this. I've looked at the schematic, but I can't see how this tone could be set. Can anyone confirm or contradict the rumor?

2143. Re: FT-51R DTMF decode? How

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-24 10:56:56 UTC
From: glenn.west@fatal.com
Message-ID: <9503240741534442@fatal.com>
Source record: 219425

My brother has the ft51r and it is a nice radio. The message (alpha-
numeric) paging function should be able to de-code dtmf, but as I recall
the message must be in this format *test 123* the asterisks are
the problem with decoding phone numbers..
I my area we "can't" use the paging functions because they might
mess up the repeater. Or so they tell me. Does anyone know if this
would be a problem with a packet controlled repeater???
Dave, I will check into the paging stuff on that 51R . My brother has
been playing with all the features and should know more about it.

>shielded wires.

Since the noise doesn't vary with engine RPM, it's not ignition noise, and messing with the high tension wiring will be a waste of time. Also, since the noise doesn't vary with RPM, it isn't alternator noise either. This sort of steady hash is usually associated with something like an electric fuel pump or a defective oil pressure sender. The former is more likely in this case. Try pulling the pump fuse and see if the noise goes away before the engine dies. If so, you've found the culprit. A good brute force noise filter mounted right at the fuel tank should fix it.

> Eric Cosens, KB9IZB

Eric Most of the newer cars have very few holes through the firewall. My best suggestion is to go to the main hot lead at the fuse panel.It is a #10 gauge wire red in color that comes into the back of the fuse or breaker box located under the dash or in the glove compartment. In twenty years of installations of Ham,stereo,commercial radio equipment.I haven't found there to be significant difference between going to there for the + lead. and then using a good body ground closer to the rig. Before the *FLAMERS* start I made a very good living at installing these things. I only worked at it by word of mouth. No ads and always had more work than I could do. Yes there were somesystems that gave me fits but not strickly from where the conection was made. I have had everything under the sun be wrong but found that this was normalmurphy's law type of thing.

eric,

i had a hard time with the power run in my trooper.
the holes have rubber sealed grommets and there is a
firewall pad in the engine compartment. look from the
engine side and poke around at any wire bundles coming through
the firewall. you may have to pry the grommet off and
then route the cable.

2156. Re: FT-51R DTMF decode? How

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-24 19:36:10 UTC
From: HVML86A@prodigy.com
Message-ID: <3kv6va$6hm@usenetp1.news.prodigy.com>
Source record: 219438

The FT-51R has a continous DTMF decode in the DTMF memory channel 9.
This decode is for digits only, and does not decode alpa information.
Memory location 9 will contain the last 15 digits that the radio received.
I hope this helps.

73,
Tom, KA3GYI

Ma> this month (hopefully) and then I would very much like to transmit
on
Ma> the 80/40/15, etc...
Ma>
Ma> Marty Wainright
Ma> (waiting for call sign
Ma> from FCC)

Check out the ARRL's 1993 Handbook. They have some transmitters for
80/40/30
meters. Very small, very inexpensive. A power supply capable of
running all
three transmitters at once cost me a whole 4 dollars. I had to buy a
premade
breadboard from rat shack and I decided to buy another bridge cause the
one I
had was harder to work around than the new one I bought. I combined
this with
my collection of spare parts (which is still a little sparce) and made
a nice
little regulated power supply capable of supplying about 1 or 2 amps.
More
than plenty for these little radios. The radios are very small and
simple.
The probably measure 3 x 4 inches (or less if you take the time to
layout the
parts better). You could build all three and put 'em in one box that
would
be about the size of an average sized CB radio. The parts for the
radio (most
of which you might have laying around) wouldn't cost more than 20
dollars or
so, I don't think. They are supposed to put out about 1.75 watts (with
a 14v
power supply) and 1.25 watts (with a 12v power supply). It should run
as low
as 8 volts. On a 3 x 4 piece of breadboard, there SHOULD be enough

room for
all three transmitters. Maybe someone else has a simple design for
80/40/30
recievers that they would like to share with me? I am getting started
in
HAM myself (getting ready to take the test in a few weeks, don't know
whether
I'm going for a code liscense or not, but I'm gonna try for it), and it
would
be nice to have a reciever to match these little beauties.

If you want, I could post the schematic for it. You don't suppose ARRL
would
mind do you? It is for the bettering of the HAM radio service.

> output. If I tap on the LMO box

Thermal problems like this are very common, especially in older equipment.
Get a hair dryer and try warming up different parts of the rig; then turn
the rig on and see if it works. This will help localize the problem.
Unplug the rig while working inside; there are lethal voltages present in
older tube rigs like yours.
The problem is most likely a resistor or capacitor that's opening or
shorting when it's cold. Glitches like this are hard to find but usually
easy to fix. Good luck.

2161. How many adjustments to new Bencher Paddle?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-24 20:53:33 UTC
From: knappsm@cig.mot.com
Message-ID: <KNAPPSM.95Mar24145333@crablegs.cig.mot.com>
Source record: 219443

Hello all!

I just got a Bencher Paddle (almost got the whole station, just need the radio ;)) and I was suprised how many adjustments I needed to make to get it to work.

When I got it the left paddle would not move, at all. It was not touching the contact. I needed to twiddle with many of the screws to get it to work. None of these screws were mentioned in the manual. I'm wondering if mine got bent or something, or is the normal. It seems to work fine now except that the left contacts do not line up as parallel as the right ones do.

Any help appriciated!
Thanks!

I have the Alinco DR600T..... has all the features you want..... I've had no real intermod problems to speak of.... even on downtown Albany NY..... I love it.... AND it has the added feature of remote (read from your handheld) control that DOES work.... fan on the PA to keep the temp down.... 3 power levels... 5-10-45(35 on 440) seperate antenna inputs.....

I'd buy another one.... if I could afford it.... new they're running in the 600$ range.... Only thing I added was the CTCSS decode module which added 65$... has everything else....

Damn! I was interested until I saw that Radio Shack had included a wide band receiver in this one. I was hoping that the mobile unit would be as selective reception-wise as the HTX-202 is. I don't need another mobile that picks up buckets of intermod...

Sure. There's a keyboard sequence to enable extended receive (including 800 Mhz). Most dealers will have it and it's also published in some guides and on some of the ham radio CD-ROMs. I can look it up somehwre if you can't find it.

Also, there's a hardware mod to enable extended transmit. It involves adding a couple of surface-mount diodes. I have a couple I can sell you CHEAP. I bought them from Icom when I had a W2A.

Steve:

I've been the proud owner of a bencher key for over three years, and I still can't figure out why my left contacts are fussier than the right! Maybe we got our keys from the same lot. In any event, once you get the adjustments right, you'll really enjoy that keyer. Perhaps I'll be able to help you test drive your new keyer some day. Congratulations, Steven.

I have a Ford Ranger pickup and I am looking for an adjustable fender mount for a CB antenna that has a 3/8-24 threaded socket. I would like one that is similiar to a regular AM/FM antenna. I have seen the large ball/pivot mounts, and I have seen the standard rooftop mounts (not adjustable for angles). The only antenna mounts I have found that are similar to the AM/FM antenna have a 1/4-20 stud or socket. Does anyone know of any suppliers that have this? (I have tried Radio Shack and local radio dealers)...

Thanks

Does anyone have a TM255 (or at least played with one)?
This is a new 2-meter all-mode rig, that sort of
superficially resembles a TS-50.

I'm wondering if it is suitable for working RS10 and maybe
AO-13. Some specific questions I had:

1- Can you put a CW filter in it?
2- Does it have a computer-control interface?

I would guess that you blew the ground trace that goes between the
microphone connector and the rest of the radio. I've done this and a
friend of mine did it. I fixed mine with a length of wirewrap wire but
it is a tricky operation.

If you run the radio off of the same power supply as the TNC (or you
have two power supplies with a common ground) then excesive current can
flow in the microphone ground connection. The trace inside the radio
runs through a flat connecting cable between two of the PC boards and is
very fragle.

JL>Has anyone connected a Hewlett Packard 200LX to a VHF TNC for 2 meter
> packet radio?

At Dayton last year, Standard demonstrated the smallest packet station,
with an HP palmtop, a PacComm TNC, and the Standard tiny walkie-talkie.
You would need the rs-232 option for the palmtop, and a flavor of
terminal software that runs within the confines of the Palmtop memory
capability. Good Luck!

I have the following electronic gear for sale. Except where noted, all of the equipment is in operating condition (but not necessarily calibrated) and comes with the operating and service manuals. Prices are C.O.D. and do not include shipping charges. I will deliver in the San Diego area.

Black Box:

Micronet 10 Code Operated RS-232 9-port Matrix Switchbox and software
Price: $100

Dana:

6900 6.5 Digit Lab Quality DMM
Price: $100

Dynell:

300 Omega Receiver. Appears to operate, but actual condition unknown.
(missing antenna and manual)
Price: $20

Fluke:

207-1 VLF Receiver and Phase Comparator. Receives from 8.0 KHz to
31.9 KHz in 0.1 KHz steps, plus 60.0 Khz. This unit is complete
except for a simple vertical whip antenna, but the PLL requires
alignment as described in the manual.
Price: $100

Heathkit:

IO-101 Vectorscope (for color TV alignment)
Price: $20
IG-1271 Function Generator (0.1 Hz to 1 MHz)
Price: $30
IG-1277 Pulse Generator (variable duration, amplitude, phase, and rep rate)
Price: $30
IG-4244 Precision Oscilloscope Calibrator (generates time and voltage
references)
Price: $40
IG-5257 Post-Marker/Sweep Generator (with cables and attenuator)
Price: $50

Hewlett-Packard:

HP-85A Computer system with built-in display, printer and tape drive.
Includes HP82903A 16K Memory expansion, HP82936A ROM Drawer with

Matrix, I/O, Plotter/Printer, Mass Storage, and Advanced Programming
ROMs, and an HP82937A HP-IB Interface. Also included are four tape
cartridges of unknown content (erasable and reusable), three
"applications pacs" (Standard Pac, Basic Statistics, and Regression
Analysis)
Price: $100

HP5300B Three Measurement Systems mainframes (but only one manual)
(Price: $50 each)
for use with any of the following 5300 series modules (all with
manuals):

HP5305B 1.3 GHz Counter
Price: $100
HP5306A Digital Multimeter/Counter
Price: $75
HP5308A 75 MHz Timer/Counter
Price: $50
HP5310A Battery Pack
Price: $50
HP5312A HP-IB Interface
Price: $50

HP8640B Signal Generator (Opt 323) 450 Khz to 550 MHz with AM and FM
modulation
Price: $600

HP9121D Dual 3.5" Floppy Drive (HP-IB) (no manual)
Price: $25

HP9133XV 15 Megabyte HP-IB Disc Drive with 3.5" floppy (no manual)
Price: $50

2194. Thanks for info and another question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-27 01:50:31 UTC
From: pbutlalj@ia.net
Message-ID: <3l55l7$3rn@allanon.ia.net>
Source record: 219378

Thaks to the people that answered my request for
information on the TH-77a cross band repeat activation. I tried to
E-Mail everyone but there was one person that I could not get to through
the Internet for some reason.

I have a new question. Does anyone have any suggestions on a UHF
only radio that is small and durable from Kenwood. I have priced the
TH-48a and the TH-42a both and the 42 seems to be the forerunner in the
race right now.

I want to stay with Kenwood as I have mics and headsets that are
made for the Kenwood in my possesion right now and I don't want to go out
and have to buy new EVERYTHING when I purchase the UHF HT. I will have
to purcahse a different battery charger but that is the way things go
with the radio manufacturers. They don't like to leave anything alone so
that when a new radio is purchased one can use the old accessories.

Thanks in advance for all the help and I look forward to hearing
from everyone again.

2195. Headset alternative?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-27 01:59:46 UTC
From: pbutlalj@ia.net
Message-ID: <3l566i$3rn@allanon.ia.net>
Source record: 219381

I have yet another question for the experts on the
Internet.

I have seen advertisements for a throat mic/earpiece that
actually gets the sound for transmission through a pickup that rides on
ones throat. Also I have seen a setup that uses a single item that goes
in the ear to both let one hear the radio and to also transmit the audio
when one talks.

I have an application where wind noise on transmit can be a
problem. The normal headset/boom mic works quite well in this
application exccept that it is hard on ones head to clamp the head band
under a bicycle helmet and ride that way all day. Also to tie it to the
helmet is not a desireable method. I would like something that is not as
conspicuous and that is why I am wondering about these two items.

The all in the ear model appears to be the least conspicuous but
I am wondering what the transmit audio sounds like. If there is a lot of
wind moving around one's face will it somehow be heard over the radio
when one transmits?

On the throat mic system. How is it held in place on one's
throat? Will it tend to constrict the breathing? This is a concern of
mine as I am going to be exerting myself on the hills and some of the
time when the wind is a headwind.

I would like any information from people that have used these in
the past. If I have to I will keep using the headset/boom mic but as I
stated above the unit is not the most inconspicuous. :-)

Thanks in advance for any information that anyone out there has.

Source record: 219384

I have used some of the 46 mHz mike in the ear radios from
Maxon and am impressed with their performance. I have not
used this type of mike with my ham gear but I keep meaning to.
I would guess this to be the best bet from a wind noise standpoint.

2200. $*$*$ 30 Weak Signal Challenge (HAM Post) - Now $40 $*$*$

$*$*$ 30 Weak Signal Challenge (HAM Post) - Now $40 $*$*$

Five weeks have passed since the original posting of this challenge.
During that period, the Web page was accessed over 1000 times.
The weak signal recording has been listen to and processed by
many. Several operators using their best audio filters have been
able to copy my call. And yet, a correct identification of the calling
station has not been made. I am increasing the amount offered to $40
and will continue to escalate the prize until someone cracks the problem.

Details on the challenge can be obtained from my Web page:

http://www.webcom.com/~af9y/

If you do not have a Web Browser, you can ftp the following:

FTP ADR: ftp.webcom.com/pub/af9y/www/

Sound File: unkn422.zip This is the Zipped Wav File

Ref Files: af9ypage.zip GIFs of AF9Y Web Page (with challenge info)
fftdsp38.zip FFTDSP Demo Program
fft422.zip View of unkn422 in next release

The winner will be announce in the UseNet groups carrying this post
and my Web page.

Final Note for those trying their own signal processing techniques:

Many have asked about the WAV file format used for the
A/D recording. The format is a PC Windows standard which
contains 43, 8 bit-bytes of header (which can be thrown away)
followed by a consecutive series of 8 bit A/D data. The sample
rate was 8192 samples/sec.

Good Luck,
de Mike Cook - AF9Y

> properly after the conversion. The radio can receive from 410-470 Mhz
> o.k. but not from 800Mhz-1Ghz. I think the problem has to do with a very
> sensitive receive ability in that frequency range.

First, I assume you mean Tm-732A, since all Kenwood mobiles (hence TM-xxx) have 3 digit suffixs.

I don't know directly the answer to the 732, but being that Kenwood keeps their radios (HTs-mobiles at least) very similar in design - I can tell you what the sister radio (the TM-741) needs.
There are two RF switches that engage in response to which freq range you tune to. The first switch in closed for 410-470, with one end attached to antenna system (through diode, impedence matchings, etc etc). The other switch closes (and the first opens) when you tune to 8xx Mhz.
Unfortunately, if 732 is like 741 there is no antenna (or anything) attached to the other end of the switch. There is a "800" silk-screened on the PCB of the 450 deck on the 741- which is where one should attach coax to another antenna- or in a worst case scenario attach to the other antenna system and suffer possible disadvantages (such as poor(er) 800 rx).

Again, I'm guessing. But check the schematic or the PCB of the 450 unit for a pair of IC's, one of which has nothing attached to pin #1- between the antenna network (found on the schematic adjacent to the power module) and the bandpass filtering for 440 rx into the detector IC.

Good luck, es 73

From: ilkka.kontola@nmp.nokia.com
Message-ID: <ilkka.kontola.36.0009C2FD@nmp.nokia.com>
Source record: 219392

Is there a connector for transverter in Icom IC 736?
If yes, what is the tx level available? Is there a connector for
RX IF (from tranverter)?

I am currently using IC 735 with SSB Electronics LT70S 432 MHz transverter.
The xverter output level in IC735 is only in order of -10 dBm, a bit too low
level for my transverter. Instead of using the xverter jack I have connected
the transverter to normal antenna connector (naturally using an attenuator).

>receive audio, or with transmitted audio.

Looks may bew the whine is present in some units while in others not?
I am running mine from a battery, so power supply is not the source.
May be someone could find a way of fixing it, or maybe Ten Tec
could suggest something.

2206. Help with HW-8 (almost zero power out)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-27 12:21:16 UTC
From: ham@wam.umd.edu
Message-ID: <3l6ajs$5j3@cville-srv.wam.umd.edu>
Source record: 219389

I have just acquired an absolutely mint HW-8. Unfortunately, no manual
was available.

I got it home and it SOUNDS fine. When you key down, there's a lovely side-
tone and the receiver blanks as it should.

However, I get no power out! And the 2N4427 (big transistor with the heat
sink) is always warm, even when just sitting in receive mode. No, let
me make that "scalding hot."

Can anyone get me a schematic ASAP? I'm itching to do some tests and figure
out how to get this bugger working.

Thanks!

2208. Ham Log 3.1 Software

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-27 13:47:22 UTC
From: rhg@sydney.DIALix.oz.au
Message-ID: <3l6fla$9sb$1@sydney.DIALix.oz.au>
Source record: 219390

Hi,

I am the author of Ham Log - the IBM computer program for amateurs to log their contacts. In its fifth year of development, Ham Log has been acclaimed world-wide.

It is a professional program that has a enormous facilities and functions, yet very simple to use. From the last review in The Canadian Amateur magazine:

"This is the first computer program I have in years that I really cannot find anything to improve on. With so many features, it is beyond this reviewer's ability to do it full justice. I rank it [Ham Log] as one of the 'breakthroughs' in computer technology applied to t his fine hobby, ranking with Baycom, JVFax and Hamcom."

In Amateur Radio Action (Dec. '94), the editor Len Shaw wrote:

"... the opinion of many, myself included, Ham Log is already the best such product on the market. In my position as editor, I get to see and use most logging programs at some time or other and from my first encounter with Ham Log, I have believed it to be the best available - and that includes some quite expensive American programs."

Now, the fully functional demonstration version of Ham Log 3.1 is available on the Internet for downloading. There are two files to grab: ham_log3.zip (about 290k) and ham_log3.txt.

FTP to ftp.une.edu.au
Ham Log is located in the directory: /pub/ham-radio/ham-log

I've had requests from several in the USA that they have had difficulty in ftp'ing to this site, for which I can only apologise. I am trying to get a response from ucsd.edu in California but have had no luck so far. Still, many haven't had problems with ftp.une.edu.au so please don't be discouraged! If you can't get it, please write and I'll do my best to get it to you by more conventional means!

If you have any queries or comments, please e-mail me at: rhg@ozemail.com.au

I'm certain you will be impressed with Ham Log v.3.1

Kind regards,

Robin Gandevia

I bought one several days ago, and I installed it in my car over the weekend. I have not owned any other mobile radios, so I can't compare it to anything else, but here are my first impressions of the radio.

The hams I talk to on a regular basis all have said the radio sounds very good over the air. The audio on the radio is also quite good, and I have no trouble hearing anyone in my rather noisey car. I was pleased to see that the radio came complete, including the wiring required to power up the radio from either the car battery or fuse box location. There are no options to buy for tone encode/decode or DTMF paging, etc. It's all built in. The radio is small enough so that I installed it in the location normally occupied by the ash tray (my car is a Chevy Cavalier,so I doubt that the ashtray is oversized).

The radio is easy to use, but you will need the manual to program it. It also comes with a quick reference car for the car.

It was also nice to be able to support a local dealer, instead of having to buy it mail order.

Actually it is on the front of the radio, not the battery.
The letters contain the openings for the speaker and the mic.
I also assume it stands for Power Out 5 watts.
Incidently, my very demanding teenage son has one and really likes it.
He uses it a lot.

Ken,
I have built and used a Hamtronics 70cm pre-amp and down converter and never had a problem with it. I mounted them in plastic containers at the antenna and could track the birds from horizon to horizon. Have not used DownEast stuff though.

2215. Most popular vintage Ham Gear???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-27 18:43:53 UTC
From: mattb@dgsys.com
Message-ID: <3l7119$a6@news.dgsys.com>
Source record: 219300

I am interested in collecting (and using) vintage Ham gear.
What are the most popular units? Why?
Which are the best performers??

Should I stick with Collins or National??

I am interested primarily in HF and also in low band AM.

Thanks for youre advice.

Uggg! Birdies EVERYWHERE! Poor noise figure! Very low margin to the
1 db compression point, etc...

I guess some fold their napkin differntly.

You can build an impressive converter from the stock parts from
mini-circuits... Hint! Don't multiply a 15 Mhz crystal.

A friend has an ICOM-W2A. It has expanded tx/rx enabled.
He can transmit FM in the aviation band... and I can hear it
on a normal Aviation band radio.

Does anyone know what the "unlock" codes or mods are to make this work?

2220. HamRadio '95 - Atlanta - April 7/8/9

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-27 20:32:22 UTC
From: Jim Stafford-W4QO <w4qo@america.net>
Message-ID: <Pine.SV4.3.91.950327153148.17151B-100000@atl1.america.net>
Source record: 219304

A new hamfest called HamRadio 95 is coming to Atlanta on April 7-8-9,1995. To be held at the North Atlanta Trade Center off I-85 and Indian Trail, the show promises to be a good one with all the big major commercial exhibitors in attendance on Saturday and Sunday. Hundreds of flea market spaces will open at noon on Friday.

To be held concurrently will be DXPO 95, a DXers delight sponsored by the Southeastern DX Club. A full track of forum speakers includes Al Hernandez, VP8SGP who has just have returned from South Georgia Island. Tony DePrato, WA4JQS, of the Peter I expedition and many other famous DXers will be speaking and in attendance. A DXPO hospitality room will be open for business at 8 PM Saturday. A DX Breakfast will start at 8:30 AM on Sunday at Shoney's with Bill Moore of the ARRL DX desk as the speaker.

Bob Grove will be a featured speaker at a Saturday SWL forum. Other forums include a QRP forum with Paul Carr, N4PC, CQ author, and Packet with Buck Rogers, K4ABT, also of CQ fame. This convention will host a number of representatives from the ARRL including Rick Palms and Frank Butler. A section called the Radio Zone will be for youth and will feature Cynthia Wall, KA7ITT, author of Night Signals. Don Miller, W9NTP, will be the featured speaker at the ATV forum on Saturday afternoon.

QCWA, SERA, MARS, the FCC, ATV, and the SE Antique Radio Society will also be topics of discussion and presentation. For further information, call 404-518-7376 or fax 404-642-9035. Dogwoods are in bloom, so join us for HamRadio 95!

Johnson is also a popular brand with vintage-o-philes.

> ...why?

Well, they're big, clunky, have lots and lots of cool looking knobs, they go "...clickHummmmmmmmmmm" when you turn them on, they glow in the dark, and they remind us of how young, hopeful, and uncompromised we all were back when we wanted these rigs more than we wanted our next breath. Maybe if we can just find ourselves a mint, unspoiled Ranger II, we can go back, erase all the mistakes, and do everything right this time around. Maybe now we can achieve the kind of simple happiness that one of these rigs would have brought us then.

Sigh...

I am looking for a decent frequency counter that will cover 10 kHz up to 100 mHz or higher. There are a few portable counters on the market that will handle this frequency range for about $200 or so. Can anyone recommend a particular counter in this price ballpark? Any used counters out there that might fit the bill? Thanx.

Message-ID: <3l7e6s$kt8@jan.et.byu.edu>
Source record: 219308

In the next week I will be buying either of these two dual bands.
(Either the Yaesu FT-51R or Kenwood TH79A(D). I've seen the 79A.
I have called several dealers who have helped me a lot but I still
can't decide. If there is anyone who can give me insights as to
which is the better radio. Some parameters: I work near many
computers so I need a radio with a good receiver. My wife got
her license and in a few months I want to get her a radio (maybe 2M)
(is the paging feature any good?). Does either radio last longer on
a single charge (for the same battery size)? Is one radio physically
stronger (e.g. battery connection) than another. Any feedback would
be greatly appreciated.

I am going to include my signature here. It will probably be
duplicated but this is the first time I've used Netscape to post
and I don't know what will be appended.

Message-ID: <MORAWSKI.95Mar27174420@starbase.azrael.mitre.org>
Source record: 219312

Regarding the Scout audio whine.

There are two ways to hear it. First, turn the volume all the way down and put your ear to the speaker. Second, plug in headphones and turn down the audio. With the right impedence 'phones it is VERY loud.

Someone from Ten-Tec told me they considered a bypass capacitor in the audio circuit to knock it down, but they weren't willing to sacrifice the high-frequency audio response.

The whine is caused by bleed-through from the microprocessor.

Dale;
Due to the age you probably have fatigued solder joints on the tube
socket or bad pin connections. Having serviced much tube equipment in my
early years I suspect the former. Resolder the wiring to the tube sockets
(might as well do them all while you have the radio apart) plus any other
solder joints that look suspicious (grey and powdery). A drop of WD40 in
the socket holes will also help remove any corrosion. Wiggle the tubes
after the WD40 treatment. Be sure to unplug the radio while working on it
and discharge any filter capacitors before resoldering. (Ouch!)

Run out to your local grange co-op or a feed and seed store. You can buy it by the mile or even smaller quanity's last I got was 12 gauge aluminum 1350' which is a quarter mile for around $20. Used some one year for a full size beverage for the 160 contest they also have good plastic egg insulators for about 50/each.

Scott, I had the same trouble as you a few months ago. I opted for the Yaesu because it has a wider receive coverage than the Kenwood. My 9.6 volt 5 watt battery sucks up the juice in a hurry. As with all 5 watt H.T.'s it makes a nice hand warmer in the 5 watt mode too. I loved the look of the Kenwood better but liked the wider coverage of the Yaesu. The TH-79 D is the latest, it allows you to lock out channels while scanning unlike the older TH-79. This feature is also on the Yaesu and the Yaesu paging feature and alpha message mode work pretty well as I have 2 other friends who also opted for the Yaesu after I did. I'm not sorry I bought the Yaesu and neither are my friends but we may have been just as happy with the TH-79..Who knows? I doubt you could go wrong with either. No matter what you choose you can get after market batteries of a higher capacity at a lower price from several manufacturers listed in Ham mags.

Following is a TX mod for the Yaesu FT-840 that I copied tonight from
Packet. I've seen a number of requests for this mod, so here it is. If
anyone tries it, let me know how it works.

73. --Leigh/KM6JE in Santa Barbara

55779 B$ 2816 840 G7MRI WW 950327 Tx mod for Yaesu FT 840
Forwarding path: KM6RZ WW6L N6IYA W6PW KA6EYH VE4KV OH3RBR OH6RBV

From: G7MRI@GB7LWB.#27.GBR.EU
To : 840@WW

Well guys i see that many people have been looking for mods for
this radio so here is the out of band tx mod.

1. take off bottom and top covers.
2. connect a jumper from point TP2003 to ground. this is temporary
while preforming the programming steps. that point is in front and to
the edge of the lithium battery.
3. with the ft-840 off, press and hold the (SSB) & (AM) buttons at the
same time. turn on the rig, then release the buttons simultaneously.

4. the display will show (02-ON). press the (AM) button to confirm
setting: it should read 7.000.00 LSB. turn rig off.
(If the rig does not show 02-on move the main freq knob to change it)

5. press and hold in the MEM , (DOWN) and (UP) buttons while turning
rig "on".
6. turn pwr off, and remove jumper.
7. if you have a problem, dump the backup memory by switching the back
up switch off per the manual.you can then redo the steps.

If you know of any mods please let me know and if you can find out what
01-ON/OFF to 09-ON/OFF i think it goes to, what do the other settings do.

The ear mikes work well. Fidelity isn't a big problem- most of the pickup
comes from bone conduction (and remember, the channel limits things to the
range 300-3000 Hz).

The biggest problem with the ear mike is people thinking you're a whacko as
you walk down the street having a conversation with invisible people...

2237. Yaesu FT 51R for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-28 10:52:35 UTC
From: pmy@ix.netcom.com
Message-ID: <3l8ppj$gal@ixnews3.ix.netcom.com>
Source record: 219338

A friend of mine who doesn't have access to the Internet is selling his FT 51R. Comes with the 5 watt battery, charger, antenna, and he's throwing in a telescoping 2m/70cm antenna. The rig has hardly been used--the battery has only been charged once--and he's only owned it for 3 weeks. He wants $475 for it. Interested parties, e-mail me.

(pmy@ix.netcom.com).

2238. 9600 Baud Packet

Newsgroup: rec.radio.amateur.equipment

I am looking to get into 9600 baud digital. Do you have a
recommendation on a radio. I am interested in a 2m/440cm dual band.
Will be using 9600 on the 440 side and phone on the 2m side.

Please Email as I do not subscribe to this newsgroup.

Thanks for your assistance and seventy-threes

I second the motion. My wife and I (KB9IZA & KB9IZB respectively) each
have one (which comes in very handy for sharing accessories) and we've
been completely satisfied with the performance of both. :-)

Someone please help me identify a display chip from an aircraft radio.
The chip is a 16 pin DIP package has "KW-515F-15," "58774," "9504" markings.
I also have a different mfg. of the same chip with "JAPAN 3015-F" marking.
It seems to me the display element is some type of filament for daylight viewing.
It may also be a vacuum floresent 8 segment display chip.
Can you tell me a second source for this chip?

Hello all

I just bought a UHF GP300, and I was wondering if anyone there is selling a keypad for the radio. The radio did not come with one, and in order for me to make autopatches toy need to have a keypad.

IF anyone has one for it, I will pay {the most} $30 for it. Please let me know by e-mail or post it over here, if you are selling one, that would be most excellent!

Thanx and 73!

2245. Re: Most popular vintage Ham Gear???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-28 15:49:56 UTC
From: markem@Primenet.Com
Message-ID: <3l9b74$lcs@news.primenet.com>
Source record: 219288

Don't forget about Drake. Although not as old as some of the others mentioned, they're still good old rigs.

Also, don't equate tubes and age with lack of performance. Many of those old radios stack up quite well against the modern gear. They usually don't have all the bells and whistles and are a bit harder to use...you can't just turn the dial and press the PTT (or key), but they still do the job.

As for why, well, I think part of it is that many of us can now afford the gear we drooled over back then but would never have been able to afford. In the late 50's/early 60's Collins gear sold for a few thousand bucks...serious money then. The set of Drake twins I paid $300 for a while back cost over a grand in the late sixties when I was going to school and working part time for a couple bucks an hour. Then there's the glow of the tubes, the smell of the warm radio and the clack of the relays when you squeeze the PTT bar on the D-104....

I wonder...will the current rigs be collected and sought-after in 30 years like the old ones are now? When radios are built into the computers will hams look back on the neat old Kenwoods and Yaesus???

Just another OF showing his age...

73.... Mark AA7TA

Message-ID: <3l9i26$hpe@legba.synergy.net>
Source record: 219313

I've got a pair of "Dataradio" modems (Cat 24F3 MRM & Cat 24F3 B1CC/BLDC)
that I would like to hook up to my 2M ham setup.

Q1: Does anyone have experience wiring these modems to the speaker/mic plug
of a typical HT (Icom/Alinco/RS/Etc.)? Any cabling diagrams/help?

Q2: Can I use one of these modems to access local packet traffic @1200bps?

If anyone has more information on these modems, I'd appreciate it.

Thanks.

Source record: 219315

Yeah, and don't forget that the older radios had some real advantages,
like the pi-network output circuits that eliminated the need for
antenna tuners in many cases. My old Knight Kit T-60 transmitter
had a pi-network that could match up to a 10:1 SWR with ease to the
final (sweep tube). No tuner needed there!

2252. Re: Yaesu FT-2400 front panel trouble

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-28 19:57:19 UTC
From: swick@huey.x.org
Message-ID: <3l9pmv$d5e@public.x.org>
Source record: 219319

From: lfloyd@netcom.com (L. Floyd)
The left lamp has apparently gone out in mine and I'm wondering how
difficult it might be to fix it or have it fixed.

No experience with the FT2400, but one of the lamps has expired in my
FT2200 and I've ignored it. All three lamps in my wife's FT5200 died
(the last two within a half-hour period) a couple of weeks ago so I
had to do something about that. Yaesu will sell you replacements.

The lamps have very fine wire leads and are soldered in. I made the
mistake of trying to completely unsolder and remove the old lamps.
Cleaning out those tiny holes in the PC board so the new leads would
fit took me far longer than I'd expected. Next time I think I might
cut off the burned out lamp leaving the leads on the board and solder
the new lamp to the old leads. If anyone can tell me how to clean
solder out such a tiny hole, I'd love to hear it.

2253. walkman headphone or something else for cw

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-28 21:02:03 UTC
From: SYJERRY@duq3.cc.duq.edu
Message-ID: <3l9tgb$fss@godot.cc.duq.edu>
Source record: 219322

I just want to get comments/suggestions/experiences as to what
is the best way to listen to cw.

I am just new to cw (3 months) and I have just used a tiny
walkman headphone (more like earphones) and I think its range
is too wide and I get ear fatigue listening to the white noise
for a while.

I just recently added an audio filter and that seems to help.
one thing I noticed is if I plug the headphones to the phone
jack, the audio level is lower as compared to plugging it in
to the speaker out jack.

are headphones designed for radio use more sensitive than walkman
headphones ?

what radio headphones do you recommend for me to get ?
(not too expensive I hope, that is, less than $10).

thanks
73 de jerry

Source record: 219325

I've got a couple of 2-meter related items for sale,
Including a Yaesu FT-11R, a 2m HT about the size of
a pack of cigarettes, in box, with manuals, charger,
AC adapter. Also the AA battery pack for the FT-11,
FT-41, or FT-51 in case you can't recharge the NiCad
in the radio. Finally, a 2m/440 HT antenna:

(Gadget) (HRO price) (asking)

Yaesu FT-11R $304 $210

Yaesu FBA-14 $24 $15

Diamond RH-77CA $35 $20

The whole batch for $225/OBO. Everything in like-new
condition...I just have too much stuff.

"...Then anyone who leaves behind him a written manual, and likewise
anyone who receives it, in the belief that such writing will be clear
and certain, must be exceedingly simple-minded..." Plato, _Phaedrus_

2257. Re: Headset alternative?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-28 22:26:46 UTC
From: gary@starcomm.overleaf.com
Message-ID: <D6690q.MMA@starcomm.overleaf.com>
Source record: 219327

You might want to look at one of the headsets made by David Clark for use by aviation ground crews. It uses a cloth (nylon strap) headband and the actual spring band that holds the earpieces against the head goes behind the head, thus keeping it out of the way of the helmet. If memory serves me, they supplied a model of this type to Motorola for their portables.

The ear-mic system seems to work well with Kenwood and Yaesu portables but NOT with Icoms. They do pick up quite a bit of ambient noise and wind noise and with Icoms, have a transmit audio level that is 10 - 20 dB below the level of the internal mic.

Good luck,
Gary, WA2BAU

2262. Watkins Johnson HF1000 for sale $3250 (one year old)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-03-29 00:00:00 UTC
From: crisp@netcom.com
Message-ID: <crispD686ts.GEI@netcom.com>
Source record: 219251
Cross-posted to: rec.radio.swap,rec.radio.shortwave,rec.radio.amateur.equipment

I have a need for cash more than my prized HF1000 (newest ROMS).

So I am offering it for sale for the low price of $3250. It is one year
old and includes the hefty service manual, the original shipping carton
and even a beta release of a program for controlling it. The program is
a port of the very nice Tom WHiteside program, NRD, and will use all
of the same logs that will work with Tom's program.

The price is $500 off of what new ones go for, so that is about 15% off.
Buyer pays shipping.

Hi, Gregg,
unfortunately I don't have a keyboard for your GP300 (Motorola ?) but be
careful If you want to use the keyboard on your GP300 you have to convince
it that now it is a gp300 with keyboard, and this operation is not really
easy, because motorola's programming software is very rigid. I can tell
you for instance that me and a friend of mine, we spent 2 Month to realize
our own software to program a VHF version of a GP300 in the
european radioamateurs band (144-146 MHz).

In any case, good luck
best 73 de IV3PYL Fulvio

(I asked)
If anyone can tell me how to clean
solder out such a tiny hole, I'd love to hear it.

From: Gerald Schmitt <ggs@aerie.lanl.gov>
I use a Dremel tool with a very fine number drill.

Yeah; thought of that. Looked quickly at my set of tiny drills and
decided I didn't have one small enough. I was concerned as at least
one of each pair of holes appeared to be through-plated and I didn't
want to risk damaging it.

Source record: 219260

Repeat after me it is NOT an Icom never was never will be. The Icom batteries fit that is it. There are NO known real mods if you find some don't try them any mods posted are BS. Those who have gone before you, and there are many, have fully explored this avenue. No mods no way no how. Buy something else if you need out of band. What you can do to some of them is improve the deviation which was adjusted too low in early models. If it is a recent one this is not even an issue. 73 de Jerry KC5EGG

Hmmm, My Alinco G1T broke and needed repair so I naturally called
Alinco...The tech immediately knew what was wrong when I explained
the prob...I sent it in and it was back exactly when he said it
would be, 8 days round trip, CO-CA-CO...He even hand wrote a note on
the invoice apoligizing for the inconvenience...

Several weeks later, I called them asking about the STEREO jacks
they used for the mike/earphone...The tech told me it was for
the 'remote control' mike they sell and even sent me the schematics
for both the Alinco regular handheld mike AND the Alinco 'remote
control' mike...He did this after I told him I had bought a
Radio Shack speaker/mike instead of the Alinco speaker/mike...

Customer service?...I can't complain...

From: davros@news.eden.com
Message-ID: <3lc8ij$b24@matrix.eden.com>
Source record: 219267

Hiy'all.

Well, I don't know why this doesn't appear to be in the FT-51 manual, but it doesn't....

Anyway, I was wondering how to erase the contents of an autodial memory, and now I know... :) (No, you can't backspace over the numbers with the band button.) You do it this way... Program the autodial memory you want to delete (hit the f/m key till it beeps twice, you know the drill), and instead of typing any numbers hit the sub/op button (the one on the side, right above the on/off button), and then the call button. The memory will then be deleted.

In case you wanted to know...

>Hopefully I don't have to be mister "tough-guy" and start punching holes
>(shiver) in the firewall. I WAS able to find a route for the power leads in
>Eric Cosens, KB9IZB

Wow, did I read that right? Drilling a hole in the firewall, where no one will ever see it, where you can plug it up with a bolt and a nut if you change your mind, where 50 years from now a judge in an antique car show might not even notice it if you enter the car for "best restoration", gives you the shivers?

I don't get it... Hams will spend thousands on towers, beams, Yaecomwood 2000SUX with built in DSP, all manner of strange and ugly things sprouting from their yard, but when it comes to the car, it's holy ground, not to be profaned with a decent-performing antenna or a real ground connection.

Drill the holes, folks. It's NICE to be able to use the repeater from 20 miles out with 4 watts.

I had the same problem: I went for the TH79A(D) though. A friend of mine went for the Yaesu. I can tell you that the Kenwood is really sensitive to computer interference. In fact, its very sensitive to any signal: the quality of the reception is a better on mine (TH79).

>>her license and in a few months I want to get her a radio (maybe 2M)

To my opinion, the Kenwood seems a bit more solid, and I can do about 7-7 1/2 hours transmission on the maximum power setting (I have the standard PB-32 battery pack that came with it: it can do about 2.7W on VHF). I havent tried the CTCSS/DTSS/paging features yet, but I have been told they were pretty effective.

>Scott, I had the same trouble as you a few months ago. I opted for the

Message-ID: <3lcm77$ns6@usenet.srv.cis.pitt.edu>
Source record: 219276

I recently preformed the extended TX and RX mods obtained
from the Interner QRZ Radio and Scanners mods from a file
titled tm733a.mod ,after preforming this mod to extent the TX on
the 440 band to work FM sat.the repeater offsets were set to the
European splits and could not be changed back.Contact with the
Kenwood tech line confirmed the fact that this was NOT an
offical mod and to undo this mod my radio would have to be sent
to a repair center or someone with a MARS CAP license would have
to obtain the corrective action from Kenwood. I have e-mailed QRZ
about this problem and hope no one else has a problem.
If anyone has a corrective action for this mod which I am led to
believe from Kenwood is on the street and the correct mod Please
help.

I fondly remember my first (1955) Allied Radio catalog. I was in 6th
grade and just getting interested in electronics. It had 1 WHOLE PAGE
of transistors, with several lines of text describing each. Only type
numbers I remember were CK721 (high-gain) and CK722 (cheap -
relatively). I acquired one of the CK722's - used it to make an audio
oscillator powered by a dime/penny/spit battery. Ahh, those were the
days. Now we use potatoes to power digital clocks. Maybe not so
different after all.

>are headphones designed for radio use more sensitive than walkman
>headphones ?
>
>what radio headphones do you recommend for me to get ?
>(not too expensive I hope, that is, less than $10).

Many communications radios are designed to drive headphones
with an impedance of 600 ohms. Most hi-fi headphones are
8 ohms, and some mini-walkman types are 45 ohms. Low impedance
headphones used with a radio designed to drive higher impedance
headphones may exhibit reduced output *and* altered frequency
response, depending on the exact nature of the radio output
circuit.

In the old tube days, this was a serious problem, but many of
today's solid state amplifiers have output impedances of less
than 1 ohm and *all* headphones act as bridging loads.

Ok, my preference is to get the selectivity I need in the
receiver IF and follow that with a wide bandwidth, low noise,
audio amplifier and high fidelity headphones. By keeping the
THD as low as possible, you'll reduce listener fatigue.

Unfortunately, most ham equipment manufacturers seem to think
that a THD of 10% is just peachy. That'll fatique you badly
in a short time. A couple of alternatives present themselves
at this point, you can modify the audio stages of the radio
to give clean audio, or you can tap into the detector of the
radio and supply an outboard hi-fi amplifier.

Audio filters are of limited help because GIGO applies, IE
once the waveforms are distorted, filtering can't restore

them. You can, however, limit some of the distortion products from reaching your ears by use of an audio filter. For minimum listener fatigue, however, you're better off doing your filtering at RF and keeping the THD as low as possible after the detector stage.

Hi Terry -

I am not aware of any other auto tuners that can be wired into the 940
but you might check the old AT 250 (the one for the 430?) - though I
do not think it is made for long wire antennas or balanced lines
either.

My suggestion is to think about using a good quality balun at the end of
your balanced line, and a short piece of coax to your rig. The 940
tuner could handle this fine, I suspect. Similarly, you can run a long
wire into a short piece of coax to the center conductor, rround the outside
and run it into the 940 auto tuner. It handles a lot of antennas fine
this way.

From: rxt@srv.net
Message-ID: <rxt.1.0015394C@srv.net>
Source record: 219285

Three weeks ago, I ordered a new Kenwood TS-850S/AT from Amateur Electronic Supply in Las Vegas. The electronic keyer unit did not work and I was advised to send the rig back to AES rather than to Kenwood because they could get it fixed faster. Since I've owned the rig, it has been on the road four days, in my shack four days, and at AES twelve days. Now they tell me that the electronic keyer is back ordered and act very indignant that I'd like to get it back soon. While I've been a ham for over 35 years, I've been fairly inactive for the last 20 or so. Two months ago I did not know AES existed. My question is are they reputable? Did I make a mistake sending the rig to them rather than Kenwood? Information and experience with this company would be appreciated.

> on a normal Aviation band radio.
>
> Does anyone know what the "unlock" codes or mods are to make this work?
>

This little trick is due to a behavior called "slope detection". Bascially,
it
allows an AM radio to demod an FM signal by virtue of the changes in the
slope
of the FM signal looking like the changes in the envelope of an AM signal,
on
an instantaneeous basis anyway.

On the other hand, an FM radio does a real poor job of demod of an FM
signal.

In either case, an FM signal in the aircraft band would probably deviate
too much to be considered "clean" under normal certification rules, but
that's
just a guess.

> really appreciate it.

(Sigh)

1. The HTX-202 is not made by Icom. It's manufactured for Tandy by Maxon.
Icom had nothing to do with the radio.

2. Most people are looking for mods that make radios receive and transmit
outside the amateur bands. If that's what you're looking for, you're
outta luck since the HTX-202 was made so that it can not be easily
modifiable to work out of band. Is it possible? Yes, if you're going to
redesign the radio's firmware - but if you had the knowledge to do that,
you wouldn't have asked here.

3. Don't worry about it blowing up. It won't. It may, however, refuse to
work after you try to modify the radio, and Tandy definitely won't work on
it if you've taken clippers and/or soldering iron to the radio (knowing
the story of one hapless local who decided that he'd try it, anyway, and
found out the hard way).

<Snip>----------

I have a TH 79 (E) that has been upgraded to 'Deluxe' standards. The (A) Has some extra software on it's microprocessor that enables channels stored in the memory to be 'locked out' of a scan. I find the function quite useful.

Oh...apparently...the American version has a different antenna too..

The 79 has suffered criticism about its intermod-rejection...I experience very little in this respect; I'm very pleased with it. I can slip it in my pocket and listen with the optional clip mic/earphone un-noticed in my office.

Battery performance is quite good too..The 79 has a power saver feature, and auto-power off.. the standard PB-32 battery lasts for a couple of days (6 hrs listening/standby /day)

The (E) can be extended to cover 800-999 MHz too simply by cutting a green wire in the CTCSS socket.

I give it the thumbs up!

Jim

Another fatigue issue is the high level of hiss often produced by the audio output stages of much amateur and SWL gear. Walkman-type headphones reproduce the hiss very well. Because the volume control is before the output stage, the signal/hiss ratio goes down as the volume is turned up. Therefore, putting a resistor in series with the headphone circuit enables you to crank the volume up a bit and reduce the hiss. Try 60 - 250 ohms. Or a potentiometer.

I can't tell what you've heard - I can only tell you what the folks that
designed the radio, and the folks that had the radio built in Korea (and
not Japan), and the folks that sell the radio say. I figure they should
know.

They have an exchange policy for 10 days only. I have purchased a
couple of things from them. All arived in 1 day by regular UPS, so
they must be close to a UPS feed. I have returned a tuner withing 10
days, and it was replaced in less than a week.

READ the policy-warranty statement in the back of the AES catalog.......
"If we can't repair the item within a reasonable length of time, we will replace
it. If the item is out of stock or back-ordered, and you can't wait for the
repair, you may request a refund, or credit towards other merchandise."
Now if this is not true, then why do I pay a little more to AES than say
Texas Towers to insure against Ralph's experience? Maybe I need to think about
this.

Hi Don,

I recently took my old IC-25A out of moth balls and
put it into mobile service. It is much more intermod
resistant than the newer rig it replaced and seems to be
hotter on RX to boot! So I think you made a good decision
to keep it! Happy hammimg.

>converter as AO-13 downlink and have never observed a birdie. the
>results one gets could vary for lots of reasons. sorry to hear that
>you had trouble with yours.

Let me confirm that the problem is not a fluke. I also had problems
with the converter. I could either get the oscillator to start reliably,
and have an output spectrum like a comb, or I could get a clean spectrum
but unreliable starting. Needless to say, I was not amused. The simple
oscillator circuit used is not reliable except with very high activity
crystals, and the one that came in my kit was not. Fortunately, a bit of
redesign cured that problem.

That still left a very crunchable mixer. Since that would require a
major redesign, the converter went into the spare parts bin and I
built one using a SBL-1 and a good solid oscillator circuit.

Now OTOH, the Hamtronics helically filtered preamps are *wonderful*.
They are well worth the money if you are plagued by nearby strong
RF sources. I use their 440 MHz preamp on my repeater in a very
high RF area. It works very well.

Chris,

Yaesu provides a drop in holder to charge the battery. This is great for those of us who do NOT want to use the radio as a charger. I have two packs, and charge one in the dropin charger while using the radio with the other. The radio has no external power connections - slight draw back. W&W Associates makes a "fake" battery that contains a switching regulator, so you can directly connect the fr51 to the car battery.

Wayne, I've heard the opposite: that Radio Shack used the basic chasis
of the Icom O2AT, and modified the design extensively. Supposedly this
was with the approval of Icom. Yup, Maxxon makes 'em.

A local ham who bought one of the very first RS HTX-202s claimed that
"Icom" was etched on one of the 202's circuit boards.

>schematics (and a good manual :))

Hi Erik -

Very broad question, and the answer depends on a lot of variables.....

There are probably 10 easily distinguished facets to beginning ham radio,
and they are all very different and require different equipment to start,
and give different results.

1. Are you interested in voice operation?
2. Are you interested in morse code operation?
3. Are you interested in digital modes?

4. Have you had a shortwave receiver, do you like HF?
5. Do you enjoy VHF repeater operation?
6. Do you like weak signal VHF work?

7. What sort of space do you have for an antenna?
8. How much money can you invest?

Etc, etc......

My advice - go find a local club and get to know some local hams to
see what is available, and touch a few radios and see what they can
do...what it takes to get the most out of them. There are lists of
kit providers, I can forward that to you if you like, but I would do
some research first....there is a lot to it!

Mike Colley wanted to know if there was a listserver
for rec.radio.amateur.swap.

tgold@microvst.demon.co.uk (Tony) replied:

> It's rec.radio.swap

Thank you Tony for the information. I stand corrected.
I'm still looking for a relay for the _swap_ group.

I have had three (3) pieces of Email from people who
wanted to receive the _swap_ group by Email!
dgf@netcom.com (Dave WB0GAZ) had looked into this
several months ago and said UCSD was worried about
"liability" and "commercial use" according to
pschleck@unomaha.edu (Paul KD3FU), my paraphrasing,
hope I got the meaning correct.

How about it out there in netland, is there any company
who would like to relay this one group as a public
service? I'm sure it would be good publicity for the
company and costs would be minimal. There are people
interested.

Thanks for any help - All the Best - Mike Colley ND1R

Same here -- I've had very good dealings with Arinco. :-) I've had them
work on my DR-1200 once after I screwed up changing the itty-bitty light
bulbs and, well.... never mind what I did to the radio trying to do that.
VA->CA->VA in under two weeks using regular snail mail.

I just got off the phone with Alinco after a very enjoyable chat with a
very knowledgable person at Alinco about some more burnt out lights <sigh>
and other things. We went over the schematic and addressed some possible
mod's and what not. Rude? "I don't think so, Tim." And heck, he spoke
plain, understandable English not the Japlish or Enganese I have gotten
when calling Yaesu tech support. <this is not a slam, I just have a hard
time understanding some orientals' English -- I'm sure that they have a
helluva time with mine :->

Posting this for a friend...
Hello all!
Our Search and Rescue Unit has received a donation of some handhelds in various states of disrepair. We need radios desperately. I will be repairing as many as possible but am in need of a few items such as
service manuals, channel elements (they were all removed), battery packs (I'll probably have to purchase these) and antennas. Any one having above items or any spare parts, please respond. Our unit is a non-profit organization and funds are scarce.
The radios we received are as follows:
Motorola MX350 high band
Motorola MX340 UHF
Motorola HT440 high band
Motorola MT500 high band
Any donations would be greatly appreciated. I can be reached via internet at ehoma@aur.com or USPS at P.O. Box 643 in Applegate, California, 94703. Thanks again.

George Vuckovic (vuckovic@interaccess) wrote:
: I'm looking for any Motorola GP300 Service manuals (16 Channel Version,
: UHF Wideband) as well as any information regarding paging capabilities
: between two GP300s. Can I, for example, us QuickCall or whatever it's
: called to turn on my partner's radio? Can Burst tones be used to do
: this? I know the Ritron Patriots are capable of this QuickCall style
: paging, but is the GP300?
The GP300 has a number of signalling decode features that are
primarily documented (like most current M radios) in the RSS
manual (radio service sofware)

The only dynamic encode is DTMF -which the radio is not able to
decode (last time I looked)

I am assuming we are talking about the US domestic model since I
believe that the European version may have the capibility for
unit to unit signalling (5/6 tone) via the keypad/display

The hardware service manual is just for fixing broken HW with
the usual parts and schematics. These do not usually document
the radio functionality to well on current production radios.

Good Luck

I have bought sveral rigs from them and they have been fine, but I've only
bought new stuff that worked out of the box first time, so I can't comment
on afetr sales service.

If I received a DOA, I would ask for a replacement or refund, not a repair.

2-5 watts??? The FCC low power broadcast rules are 100 mw... that is
.1 watt, yes, that is correct, 1/10 of a watt. If you want to transmit
more than that, you must have an FCC license.

Source record: 219148

I have a Heath SB-102 for sale. Serial # is 010 4814, with original manual, loads of QST articles, including original review. Used last weekend for a few hours during the CQ WW WPX contest and worked 72 stations in over 40 countries, including most of Europe and South America with a fairly poor long wire antenna and tuner. Rig is in very good physical condition, inside and out. Has not been used often during the past 5 years.

It comes with CW filter, HP-23A power supply w/manual, HP-13 Mobile DC power supply (no manual) and SBA 100-1 Mobile Mount w/manual (a few small parts seem to be missing).

Asking $225 + shipping for the whole package.

This is a heavy station and local delivery/pickup would be preferred - greater Washington, DC area.

Hi,

This is another request for a design for a receiver circuit that
will detect a 5KHz carrier signal.

It needs to be a compact and low-power. It's detecting a 5KHz
pulse that's being generated from a very weak transmitting source.

I had a promising reply from Paul Wenz but am unable to contact
him via email. Paul, if you read this can you email me your
fax or email address where I can contact you.

Thanks in advance,

Peter.

Message-ID: <3li24e$t0q@uwm.edu>
Source record: 219152

I have a Dentron 160-10 HF amp (like the Clipperton L) that I'm having some problems with. The output is kind of low and and the plate current seems a bit too high. With 100W of drive it puts out about 600W. Plate voltage seems ok (1700 - 2200 volts) but with the key down it's running at about 800 mA. Max current for the 4 572Bs should be around 1.0 amp. The tubes are old but seem ok and when I swap in a new, known good tubes I get the same results.

What are normal current values for a given drive/output level ? Any ideas about what to check ? I've got a schematic but that's about it.

Thanks for any help.

|
In Sailing magazine this month, they have a detailed article on battery usage for yachts. They give some advice for lead-acid battery management that is counter to the conventional wisdom for boats with dual batteries. This advice also runs counter to conventional wisdom for using Ni-Cad batteries. I would like to know if some of the experts reading this group might tell me if the following is relevant to using Ni-Cads in handheld radios.

In boats it is common to have two batteries that alternate in service, one being discharged deeply while the other one charges and "rests". The author contends that this results in shorter battery life because the life of a battery is extended significantly if it is discharged a smaller percentage each time before it is recharged. They suggest using both batteries at the same time thereby discharging each one less.

The question that comes up is, "Does this apply to Ni-Cad batteries as well?". I have been told to discharge my Ni-Cads almost completely before recharging to avoid the dreaded "memory effect". However, I don't want to shorten the battery life unnecessarily. Any advice on how best to manage Ni-Cads?

Thanks,

Michael

Hi All,
I was able to view a recent issue of the Japanese "CQ" magazine and Alinco was advertising their new mobile HF. This version had some 160M operation and all the remaining bands to 10M at 100W. PLUS 6Mtrs included in the same radio at 10W! The design of the front panel looked very clean and appears to be comparable to the Knwd TS50 in size.

Sorry I can't decipher Japanese characters so I don't know of any more details. The suggested retail price was steep though....abt $1500 US.

From: k8mr@barf80.nshore.org
Message-ID: <BZ8T3c3w165w@barf80.nshore.org>
Source record: 219157

I'd like to add a noise blanker to my Drake TR-6, but I assume that the chances of finding a 9-NB are slim to none. Therefore I'm thinking about rolling my own. But before I put a lot of work into the project, has anyone out there already done this, or seen any articles on this sort of project? Are there any recommended noise blanker circuits to use as a starting point?

An EE friend told me he vaguely remembers an integrated circuit (possibly by Plessey) that was an IF amplifier with a noise blanker included on the chip. Can anyone provide any further information on such a chip?

I'm also considering adding an FM demodulator to provide FM receive capabilities. Is there a recommended IC/circuit for such an application? The TR-6 uses a 9.0 MHz IF.

Thanks,

> best to manage Ni-Cads?
>

The best way to manage Ni-Cads is to not overcharge them. In any
normal use, memory is a myth. If you repeatedly discharge and charge
them between precisely the same points you can develop the "memory"
effect, which is really a voltage depression of .1 or .2 volts per
cell. If the load is sensitive to the battery voltage it may
interpret the voltage depression as "battery almost discharged" and
shut down. This effect has been noted in spacecraft with
sophisticated charge circuits which can cycle the battery precisely
enough.

What happens with earthbound Ni-Cads is overcharging, which overheats
the cells, causing outgassing, loss of electrolyte and thus capacity,
and other degradations. So charge your Ni-Cads whenever you want to
be sure they're topped off, and either use a smart charger which can
tell when they're fully charged, or charge them at the 14-16 hr rate,
at which a moderate amount of overcharge won't hurt anything. What's
moderate? Hard to give a specific value. When I slow-charge, I
assume the battery was dead and give it the full 14-16 hrs. If it
wasn't dead, it doesn't get more than probably 6 or 8 hours of
overcharge. That's not going to hurt anything. I certainly wouldn't

leave one on for days at a time, however.

Believe it or not, Radio Shack has (or had) such a device for $99.
I saw a review on it a few years ago. Unfortunately, it has to
use a special probe that has a button on it. (for blind people, this
is a way of distinguishing them, tho). A few weeks ago I saw one on
clearance at the local Radio Shaft for $69. I should've picked it
up. Oh well. Maybe I'll see one again at the local hamfest? (Dayton
Hamvention in April! Whoohooo!!)

The charging terminals are on the pack. The standard Yaesu charger won't
charge all the batteries. The extra cost quick charger will and so will
the Master Charger from W&W and their battery packs are cheaper too...

The 100 and 200 are great for packet as they use an 80 column terminal
scrteen, unlike the tandy m100. The serial port is a 3 pin affair and
you will need the HP connectivity kit (or just the cable) and probobly
a 9-pin null modem to re-invert the send and rx lines. I have run
packet on my hp48gx calc for about 9 months and if that works, a DOS
machine should be a snap.

I own a TM733 and it seems to work fine. I wish it had some of the features of the Yaesu, like a lighted mike keypad. It also has a strange behavior where it drops carrier right before sending DTMF codes from the DTMF memory. I took it to Kenwood and they said, "Sorry, that's the way it works - tell your repeater owner to change his timing for phone patches".

Other than these minor things, I am pleased with the radio. Kenwood's attitude is not reassuring so I hope not to have to service it soon.

In <D6AEu1.Ht3@cup.hp.com> Michael Cole
<Michael_Cole@hp6650.desk.hp.com> writes:

Regarding NiCad life:

1. Shallower cycles will extend the cycle life. Typical cycle life
is 300-400 deep cycles. Discharges to 80% capacity remaining
can increase it by 2 to 3 times. Remember that there are other
issues involved with battery life than just cycles. Discharge
rates, charge rates, temperature and plain old time take their
toll also.

2. Full discharge on every cycle is NOT necessary to solve problems
of "Memory" or temporary loss of capacity. It's ok to do, but
you will get minimum cycle life out of your battery. I'd
suggest 1 full cycle in every ten to help excersize the battery.
This can be diffucult to administer and is not an exact figure
by any means.

3. "Memory Eraser" or refresh type chargers often fully cycle
(discharge prior to recharge) the battery every time they
charge. Again, this is OK, but this will reduce cycle life.
These chargers have become popular for camcorders and cell
phones.

Everyone has an opinion on batteries, and most of us are wrong :)
As with humans, age takes it's toll on batteries and the best kept ones
still fail due to aging.

This is certainly not my experience with Alinco. I have had
occasion to return Alinco products to them for service (usually user
induced malfunctions) and have had quick turn around (10 days or less),
effective service and helpful advice. I have yet to be charged a dime
(even though the last repair was on a transceiver that was months out of
warranty). Before I purchased each of my three Alincos, I called Alinco
and obtained literature and operating manuals, again at no charge. I have
communicated with numerous other Alinco owners who have had experiences
similar to mine.

While Alinco products may not always have the latest features,
their competitive pricing and outstanding service will assure that I will
consider them in the future.

This is very true with Lead Acid /SLA (gell-cells), but less so with Nicads.
Shallow and deep cycles are not terms associated with NiCads. Depth of
Discharge (DOD) is not a spec used with nicads in determining useful life.
As long as the battery isn't taken so low that the cell reverses, it is ok to
take it to 100% discharge without reducing the lifespan of the battery.

Care of Nicads is very different from care of lead acid batteries. In some cases, the care of lead acid batteries is exactly opposite that of Nicads. Generally, lead acid or sealed lead acid (aka SLA) (also known as Gel-Cells, which technically is not an accurate description, since this was a "trade" name the Globe Batteries used for their SLA batteries), will last a long time if the batteries are not discharged too deeply. They can also be floated with a charge indefinitely since SLA batteris will only draw the charge they need. This makes them great for backup power. Their relatively low price makes them the main workhorse of the battery industry. There are much better technologies out there (like Chloride batteries), but their high price makes them rare in non-commercial applications.

Nicads can be discharged all the way without damage to the battery. They should not be left floating on the charger for long periods of time. While SLA batteries use a constand voltage source for charging, Nicads require a constant current source. Slow charging is better for the batteries than fast charging (I usually use the 60-80mA chargers for AA batteries). Repeated use is not a problem - there is no need to let them "rest", but if you are using a slow charger, then charging could take 12-20 hours, so an extra set of batteries is a good idea.

While there is scientific theory and proof of the memory effect, it is not something that you have to worry about. Most nicads are killed by overcharging, not memory effect. Others are killed by dendrites or voltage reversal. A nicad battery should be stored in a discharged state (1v. per cell). This will avoid dendrites. Voltage reversal can be avoided by not over discharging a battery pack, but if the batteries in the pack are mismatched, cell reversal may be unavoidable - thats why it is not advisable to buy cheap battery packs (or Radio Shack nicads in some cases).

If you need more info on SLA or Nicad care I can post some of the info I've collected.

I run a JPS NRF-7 mobile mostly on SSB. I find the Peak with auto notch is very
nice for mobile operations. I do not think it helps copy much that I could
not copy with out it, but I find that it substantially reduces my fatigue. I spend
a lot of time puting out counties on the county hunters net so I am often trying
to pull out weak signals and it helps me keep going. I selected the NRF-7
for mobile ops because of simple operations with single knob. When driving
I want to concentrate on the road not the radio.

I hope this helps

I have bought sveral rigs from them and they have been fine, but I've only
bought new stuff that worked out of the box first time, so I can't comment
on afetr sales service.

If I received a DOA, I would ask for a replacement or refund, not a repair.

Hmmm, My Alinco G1T broke and needed repair so I naturally called
Alinco...The tech immediately knew what was wrong when I explained
the prob...I sent it in and it was back exactly when he said it
would be, 8 days round trip, CO-CA-CO...He even hand wrote a note on
the invoice apoligizing for the inconvenience...

Several weeks later, I called them asking about the STEREO jacks
they used for the mike/earphone...The tech told me it was for

the 'remote control' mike they sell and even sent me the schematics
for both the Alinco regular handheld mike AND the Alinco 'remote
control' mike...He did this after I told him I had bought a
Radio Shack speaker/mike instead of the Alinco speaker/mike...

Customer service?...I can't complain...

>results one gets could vary for lots of reasons. sorry to hear that
>you had trouble with yours.

Let me confirm that the problem is not a fluke. I also had problems
with the converter. I could either get the oscillator to start reliably,
and have an output spectrum like a comb, or I could get a clean spectrum
but unreliable starting. Needless to say, I was not amused. The simple
oscillator circuit used is not reliable except with very high activity
crystals, and the one that came in my kit was not. Fortunately, a bit of
redesign cured that problem.

That still left a very crunchable mixer. Since that would require a
major redesign, the converter went into the spare parts bin and I
built one using a SBL-1 and a good solid oscillator circuit.

Now OTOH, the Hamtronics helically filtered preamps are *wonderful*.
They are well worth the money if you are plagued by nearby strong
RF sources. I use their 440 MHz preamp on my repeater in a very
high RF area. It works very well.

Subject: Erasing Autodial memories on FT-51

Hiy'all.

Well, I don't know why this doesn't appear to be in the FT-51 manual, but it doesn't....

Anyway, I was wondering how to erase the contents of an autodial memory, and now I know... :) (No, you can't backspace over the numbers with the band button.) You do it this way... Program the autodial memory you want to delete (hit the f/m key till it beeps twice, you know the drill), and instead of typing any numbers hit the sub/op button (the one on the side, right above the on/off button), and then the call button. The memory will then be deleted.

In case you wanted to know...

Subject: How to best manage Ni-Cad batteries?

|
In Sailing magazine this month, they have a detailed article on battery usage for yachts. They give some advice for lead-acid battery management that is counter to the conventional wisdom for boats with dual batteries. This advice also runs counter to conventional wisdom for using Ni-Cad batteries. I would like to know if some of the experts reading this group might tell me if the following is relevant to using Ni-Cads in handheld radios.

In boats it is common to have two batteries that alternate in service, one being discharged deeply while the other one charges and "rests". The author contends that this results in shorter battery life because the life of a battery is extended significantly if it is discharged a smaller percentage each time before it is recharged. They suggest using both batteries at the same time thereby discharging each one less.

The question that comes up is, "Does this apply to Ni-Cad batteries as well?". I have been told to discharge my Ni-Cads almost completely before recharging to avoid the dreaded "memory effect". However, I don't want to shorten the battery life unnecessarily. Any advice on how best to manage Ni-Cads?

Thanks,

Michael

Hi, Gregg,
unfortunately I don't have a keyboard for your GP300 (Motorola ?) but be
careful If you want to use the keyboard on your GP300 you have to convince

it that now it is a gp300 with keyboard, and this operation is not really easy, because motorola's programming software is very rigid. I can tell you for instance that me and a friend of mine, we spent 2 Month to realize our own software to program a VHF version of a GP300 in the european radioamateurs band (144-146 MHz).

In any case, good luck
best 73 de IV3PYL Fulvio

From: HVML86A@prodigy.com (Thomas May)
Subject: Q: Yaesu FT-51R battery charging

Chris,

Yaesu provides a drop in holder to charge the battery. This is great for those of us who do NOT want to use the radio as a charger. I have two packs, and charge one in the dropin charger while using the radio with the other. The radio has no external power connections - slight draw back. W&W Associates makes a "fake" battery that contains a switching regulator, so you can directly connect the fr51 to the car battery.

Subject: SAR Help Needed!

Posting this for a friend...
Hello all!
Our Search and Rescue Unit has received a donation of some handhelds
in various states of disrepair. We need radios desperately. I will
be repairing as many as possible but am in need of a few items such
as
service manuals, channel elements (they were all removed), battery
packs (I'll probably have to purchase these) and antennas. Any one
having above items or any spare parts, please respond. Our unit is a
non-profit organization and funds are scarce.
The radios we received are as follows:
Motorola MX350 high band
Motorola MX340 UHF
Motorola HT440 high band
Motorola MT500 high band
Any donations would be greatly appreciated. I can be reached via
internet at ehoma@aur.com or USPS at P.O. Box 643 in Applegate,
California, 94703. Thanks again.

I can't tell what you've heard - I can only tell you what the folks that
designed the radio, and the folks that had the radio built in Korea (and
not Japan), and the folks that sell the radio say. I figure they should
know.

2379. Recruiting Elmers from the Internet

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-01 00:00:00 UTC
From: pschleck@gonix.com
Message-ID: <pschleck.796747779@gonix.com>
Source record: 219162
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.policy,rec.radio.amateur.space

As readers of the rec.radio.amateur.* newsgroups are probably aware, I maintain a periodic information posting known as the Amateur Radio Elmers Resource Directory (aka the "Elmers List") which provides a list of net Elmers, indexed by topic, and their E-mail addresses. (For users of threaded newsreaders, this article is linked to the base article of the Directory itself).

As noted elsewhere, the Amateur Radio Elmers Resource Directory is 4 years old as of last month. In order to maintain its value to the net, I have strived to keep it accurate and up-to-date. In addition to reviewing the currency of the entire list every 2 years, I am constantly scouring the newsgroups for new Elmers to join the list.

There's always been an implicit invitation for any qualified person to join the list. However, since I've lost about 1/3 of the list due to attrition from my last biannual mass-ack (i.e., no response at their last-known E-mail addresses), felt the need to send out this explicit invitation. I'd like to replace the lost Elmers with new, motivated, quality Elmers from the net. Areas of expertise that are most desirable for the list right now include:

- Military Affiliate Radio System (MARS), particularly Army and Navy/Marine-Corps. MARS (as I currently don't have any MARS Elmers from those branches)
- Advanced homebrewing techniques (surface-mount, VLSI, DSP, spread-spectrum, etc.)
- TCP/IP Packet Radio and Gateways/Internetworking (particularly local IP coordinators and/or subnet managers/operators/leaders)
- Amateur Satellites/Space Operation (particularly Microsats and SAREX)
- Amateur-related Software for Unix/PC/Mac/Amiga/Psion/HP-95
- College Clubs and organizational guidance/strategies
- Boy Scout Amateur Radio Merit Badge Counselors
- Unix/Linux/X-Windows programming and configuration
- Amateur Radio Organizational Contacts (I am especially looking for contacts for the ARRL Field Organization, GRAPES, AMSAT, QCWA, QRP Int., NARA(?), QRZ, CSVHFS, LAMBDA, ARES, RACES, FEMA, any state OES or EMA, as well as any regional frequency coordinating body)
- Band, Mode or, Brand-specific equipment (actual manufacturer or dealer contacts would be quite welcome, as long as they reveal their affiliation and at least provide *some* free services)
- Maintainers of unique amateur-radio-related anonymous File Transfer Protocol (FTP) sites and World-Wide Web (WWW) Home Pages (as opposed to those that are substantially a rehash of, or pointers to,

existing sites).
- Maintainers of unique amateur-radio-related mailing lists
- Editors/contacts for amateur-radio-related publications

Although expertise in any other area would, of course, be welcome also.

I'd like to emphasize that participation is totally voluntary, with very minimal obligations (1 or 2 polite inquiries a month, if feedback from existing Elmers is any indication). If you find that it is too much work, you are welcome to bow out, no questions asked. In the 4 years I have managed the list, only a handful of Elmers explicitly resigned, and usually only because of severe professional or personal obligations, or their interests or expertise changed. You don't even need access to netnews, just a reliable E-mail address.

I've also attempted to seek out people on the net who I think would be good Elmers. If you've received a personal E-mail invitation from me, I urge you to give it serious consideration. The net would appreciate your volunteerism.

If you'd like to volunteer, or just discuss further what volunteering would involve or if your contribution would be desirable and fit within the Elmers List's mission and editorial policies, send me some E-mail to the Elmers list administrivia mailbox below (the default Reply-To: of this message; an autoreply daemon will respond with an acknowledgement message and I'll be in touch with you personally very soon).

>communications device.

There is no such animal. A HT is a very specialized piece of radio
equipment. While many people try to press them into other uses than
belt portable operation, they will not perform well in such service.
Noting that you are working toward a General ticket, it should be
pointed out that the common HTs are all for VHF/UHF FM operation,
and are not usable for HF. They also aren't good substitutes for
mobile or base rigs operated on external antennas.

Now, keeping the above firmly in mind, the key features you want
in a HT are low susceptability to intermod, which rules out any
HT with wide band receive, ruggedness, which rules out many of
the tiny HTs, and good battery life, which fortunately today
includes most HTs. Two good HTs to consider are the Radio Shack
HTX-202 and the Icom IC2GAT for 2 meter use, or the HTX-404
and the IC4GAT for 70 cm use. Among dualbanders, all have
wide band receive capability, and will howl and screech when
connected to an external antenna, and often when not connected
to an external antenna. The best of these is arguably the
FT-530 simply because it's easier to *use* than most of the
others. No HT is a substitute for a real radio, but for the
specialized belt portable application, these will suffice.

>
>In boats it is common to have two batteries that alternate in service,
>one being discharged deeply while the other one charges and "rests".
>The author contends that this results in shorter battery life because
>the life of a battery is extended significantly if it is discharged a
>smaller percentage each time before it is recharged. They suggest
>using both batteries at the same time thereby discharging each one less.

It's true, deep discharges will shorten a battery's life. Special
deep cycle marine batteries are very heavily over-built to tolerate
this abuse, but it is still abuse. You'll get longer service life
from a battery if you limit discharges to the point where the battery
is reduced to 80% capacity, IE only 20% of the battery's nameplate
capacity is really usable if you want maximum service life. A battery
is not like a muscle, exercise isn't good for it, and resting it won't
make it stronger.

The purpose of using two batteries alternately is so that you won't
find yourself in a situation where *both* batteries are dead. This
is a commonsense way to operate a vehicle battery system. Using
both batteries together would require you to watch discharges very
carefully to avoid getting caught in this situation.

Lead acid batteries can tolerate an occasional deep discharge to
nearly zero terminal voltage. It's not good for them, but they'll
usually survive.

>The question that comes up is, "Does this apply to Ni-Cad batteries as
>well?". I have been told to discharge my Ni-Cads almost completely
>before recharging to avoid the dreaded "memory effect". However, I
>don't want to shorten the battery life unnecessarily. Any advice on how
>best to manage Ni-Cads?

NiCad chemistry is different, but some of the same ideas still apply.
The manufacturers typically rate their batteries for 500 full charge/
discharge cycles, or several thousand partial charge/discharge cycles.
The dreaded memory effect is mostly hokum, though you can get a voltage

depression effect with repeated partial discharges to exactly the same terminal voltage followed by *overcharging* the pack. This is usually caused by equipment with automatic voltage cutoff circuits that are set too high for the battery being used.

While individual NiCad *cells* can tolerate discharge to zero volts, NiCad battery *packs* cannot. You should never discharge a *pack* to less than one volt per cell, or you run the risk of *reversing* the polarity of the weakest cell in the pack. This is always damaging. So for example, a 10 cell 12 volt pack should never be discharged to less than 10 volts.

Punch a hole in any pile-up with this Kenwood TL-922 2KW HF AMP.
This is the current model from Kenwood...and it is in like new
condition.

The AMP has had very little use because I live at 8,000 ft in
Colorado and have a 4 element 20 meter monobander.

The Price is $1295.00....this is a savings of about $700.00 over
what HRO is selling them for new. I will consider taking Leica Camera
equipment in trade.

The AMP is located in Denver, COLO and I can ship it anywhere.

Contact me on e-mail, or by phone days at (303).274.7545 or phone
evenings at (303).674.0510.

Hi Mike. You can only expand the TX on the 2500, not the RX. To expand the TX, take the top off the radio. Cut the thin green wire atop the board. That's it! Be careful on reinstalling the top cover to make sure the little plastic plug is positioned correctly. 73/Terry VE4UC

2387. FS: Ranger 2950 and scanners

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-01 00:00:00 UTC
From: stew@sam.neosoft.com
Message-ID: <stew.25.0075182D@sam.neosoft.com>
Source record: 219170

I've got a few things for sale:

- One Ranger 2950 ten meter rig in absolute mint condition. Has instructions, documentation, all original brackets and accessories and original box. I am selling this radio as a package deal with a 250 watt 10 meter HF amp. This amp has a built-in pre-amp, and a toggle switch for SSB/AM operation. This amplifier may ONLY be used by a licenced amateur operator. You also get a high power SWR/power meter (up to 1000 watts) with mounting bracket. All this for $400.00.

- Pro-34 hand held 200 channel fully programable scanner. This scanner covers all the usual frequencies as well as 800Mhz. It is cellular restorable. $175.00.

- Uniden Bearcat 200XLT hand held 200 channel fully programable scanner. This scanner also covers all the usual frequencies and 800 Mhz. It is also cellular restorable. $175.00.

Please email me if you are interested in any or all of the above. Thanks!

Stewart

From: pmarkou@ferrets.iii.net
Message-ID: <3lkiu6$jas@news.iii.net>
Source record: 219174

Hi and tnx for reading this note. I am considering purchasing an ICOM 2700H dualband and would like to hear comments about the radio (both good and bad). I need a radio with a detachable front panel because I have a tricky installation.

Also, anyone that can provide info about the following would be most appreciated:

1) What does it exactly mean when a radio is 1200/9600 Baud ready. Is the IC2700H?
2) I assume the radio does cross band repeat?
3) What separation kit do you need to detach the front panel?
4) Is ICOM still throwing in the IR wireless microphone? If so how does it sound?

Tnx and 73's

2393. ADVICE WANTED: Backpackable SW Receivers

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-01 00:00:00 UTC
From: johngbp@aol.com
Message-ID: <3ll2k4$h6r@newsbf02.news.aol.com>
Source record: 219176

I would like to hear your recommendations for a portable SW receiver that is small enough to take along on hiking and backpacking trips. Desired but not required features include SSB reception, FM stereo, digital display, keypad tuning, and synchronous detection. Opinions on the pros and cons of various models would especially be appreciated (e.g., Sony SW 7600G, Sony SW 100S, Grundig YB 400, and others). Thanks much for your input.

2394. Handheld trasceivers recommendations requested

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-01 00:00:00 UTC
From: shade@primenet.com
Message-ID: <3li8at$gcc@news.primenet.com>
Source record: 219177

I am looking to obtain my General ticket soon and am looking for an excellent handheld to be my only transceiver. Later, I may install an antenna and the like to connect to the handheld, but will be using only the handheld for quite a while.

Anyone have any recommendations on which transceivers & features I should look at and/or which models & features I should avoid?

Exapndability is the biggest factor I want to consider. I want to purchase a top-notch handheld so I can later connect it to my computer and use it as a mobile communications device.

Thanks in advance.

Responsibility and risk-taking
are the hallmarks of maturity

From: gianotti@aol.com
Message-ID: <3lmjkc$oq1@newsbf02.news.aol.com>
Source record: 219183

My two cents worth.

I bought the Kenwood 79A(D). The unit failed five minutes out of the box.
I sent it back for repair and ending up getting my money back. I almost
purchased the Yaesu (I love the 530 I have had) but got the new ICOM Z1A
instead. Nice radio.
I also noticed much computer interference with the Kenwood.

Message-ID: <3lm77r$6in@thor.inlink.com>
Source record: 219195
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

Never discharge a Ni-Cad below 1 volt. If you fear memory loss, simply
give the battery a simple 2000mike zap at each charge.

If you need to rejuvenate a stubborn ni-cad, use a 10,000 to 50,000 mike cap
and zap the little bugger about 5 times and then recharge in the normal way.

Date: 1995-04-03 00:00:00 UTC
From: dl278@cleveland.Freenet.Edu
Message-ID: <3lnfti$6cv@usenet.INS.CWRU.Edu>
Source record: 219105
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I just picked up a Heath HX20 at a fest. Of course, I'm now
in n eed of a copy of the manual. The usual conditions, I'll
pay for copying and postage. To reduce the cost and time,
I don't need the kit building step by step instructions part.
The theory/description, specs, parts list, schematic, alignment,
use and troubleshooting, and perhaps a layout or two will do
(and probably will be enough work!).

Thanks,

Bill

: Hi and tnx for reading this note. I am considering purchasing an ICOM 2700H dualband
: and would like to hear comments about the radio (both good and bad). I need
: a radio with a detachable front panel because I have a tricky installation.

: Also, anyone that can provide info about the following would be most appreciated:

: 1) What does it exactly mean when a radio is 1200/9600 Baud ready. Is the IC2700H?
: 2) I assume the radio does cross band repeat?
: 3) What separation kit do you need to detach the front panel?
: 4) Is ICOM still throwing in the IR wireless microphone? If so how does it sound?

: Tnx and 73's
: Peter WB1DWK

1. As far as I know, the radio is NOT 9600 ready. 1200 can be run using
the mic/speaker jacks. There are no special data in/out connectors
on the rig.

2. It does cross-band repeat when running in remote DTMF control mode.
I haven't found any way to turn on/off the X-band function from the
front panel or mic. BTW, I highly recommend the purchase of the voice
synth. if you want to run the rig in remote DTMF mode. It turns into
quite a powerful remote base radio.

3. You'll need a separation kit to remote mount the front panel. There's
several kits available with various cable lengths. Incidentally, the
face plate detaches very easily (almost too easily).

4. I can't say much about the IR mic as I don't have one.

Hi there fellow hams... I am pondering about purchasing a mic unit. I have tried the throat mics and wasn't too impressed but they do work... I have HEARD about these ear-mic that pick up the air vibrations in your ear and then the regular head sets. What other ways are there to tx (besides speaker-mics and into the radio itself...) I do a lot of skiing and want to be able to ride a bicycle and etc. while still tx'ing. I think I heard that the ear-mic is NOT vox??? The troat mic is and the headsets are obviously voxable. I would rather stay away from ptt's but I can stick with them. I guest I would like to know your expiriences and comments if any, and any other mic that are out there.

Help?

I am considering the purchase of Yaesu transmitter and Receiver,
FL-101, FR-101D.

I would invite general opinions on the performance, receiver quality,
reliability and value of these units.

I intend to operate primarily CW and some Fone.

Thanks for your input.

Matt Brosious, N2NBT

I am truely happy for you. My experience with Alinco has been negative, two-fold.

First, I purchased an Alinco 110 mobile from a local dealer, the VCO was
bad and would not hear above 147 Mhz. I returned the unit for repair, and
did not hear from the dealer for two weeks. When I finally called him, he
jumped on my case on the way I shipped it back to him (which I followed
HIS instructions). When I related this to him, he said he could prove that
I was incorrect because he tapes all his phone conversations (which at least
```

in NC it is illegal to do without a notification tone every so often in
the conversation, or a verbal agreement at the beginning of the conversation).
When I immediately asked him to produce this "proof", he went off for a
couple of minutes (on my nickel) and came back proclaiming he "must have lost
his tape". He finally sent me another radio, and I discovered that the original
rig (I had saved the original box) was a return, the serial number had a typed
stickover label.

When I related this story to Alinco, they wrote back (handwritten) how wonderful
this dealer was, and I must have caught him "on a bad day".

Secondly, I decided to give them a second chance. I purchased a 580 HT (from another
dealer). The DSQ was inoperative. I discussed the matter with their repair
department, and was specific about the problems and when I needed the radio
back. I also put the same information in a letter and shipped it with the unit,
with return shipment. They keep the rig and sent it back late, claiming there
was no problem. I discussed it with the "customer service" people, and they
said they would look at it again, and they would pay shipping (reimberse, which
they never did). They kept the unit a couple of weeks, sent it back, and the
problem was WORSE. I sent it back a third time, they said would pay shipping
(reimberse, which they never did), replaced a resistor, and the unit now worked
mostly correct.

So you see, I would not have very much confidence in their capabilities.

>and zap the little bugger about 5 times and then recharge in the normal way.

Gary, zapping a NiCad can sometimes burn off a dendrite that is shorting a cell, but it won't do anything for voltage depression (aka memory effect). The best thing to do about voltage depression is to avoid it. You can do this by *not* discharging the battery to the same point each time, and by *not* excessively overcharging the battery. If you do get a voltage depression effect *and* you can access the individual cells in the pack, then discharging each cell *individually* to zero volts, and then giving a full slow charge to the cells, will "erase" the "memory". This will reduce the life of the battery, so it shouldn't be a routine practice.

The best way to deal with "memory" is to not cause it in the first place. Make it a practice to vary when you change and recharge packs on your radio. Don't always run it all the way down, and don't always change it after a fixed number of hours of use. Try to recharge the battery when it is in some random state of charge, and use a charger that will detect the "droop" when the battery *just* reaches full charge and *stops* charging at that point.

Handheld or base unit? I'd go with a handheld. Either the AOR AR8000
(most bells & whistles) or the Yupiteru MVT7100 (best RF performance).
The AR8000 goes for around $569 to $649 and the MVT7100 goes for around
$500 to $600. Since money is no object, buy me one of each! :-)

Yea, Your right, the varying conditions of HP test equipment probably
goes quite a way in explaining the presence of LO birdies.

NOw, mind you, I've never used it "on the air", with it's abismal performance
"on the bench", I didn't bother.

Also, to be fair, The Ham-people who sell this unit, did make great fixes,
after it was returned unacceptable. It now has some gain, it has some
isolation, it has a few db distance between the 1db compression point and
the radiated power of the LO.

Glad you get good service from your converter.

>bit too high. With 100W of drive it puts out about 600W. Plate voltage seems
>ok (1700 - 2200 volts) but with the key down it's running at about 800 mA.

Gee Fred I don't know what you expected! That doesn't sound too bad. The gain
of the 572's is identical to 811A's (at the same plate voltage). So if the
loaded plate voltage is below 1500 volts that output power is acceptable. If
the loaded (operating) plate voltage is 1700 volts at .8 amperes that's 1360
watts input. That's less than 190 watts per tube dissipation, and probably 45
to 50% anode efficiency (remember some efficiency and power is lost in the
tank). That seems acceptable for the technology used in the 572 tube and that
particular amplifier design.

>Max
>current for the 4 572Bs should be around 1.0 amp. The tubes are old but seem

>ok and when I swap in a new, known good tubes I get the same results.

Tubes must be good!

>What are normal current values for a given drive/output level ? Any ideas
>about what to check ? I've got a schematic but that's about it.

Depends on lot's of things...accuracy of meters, are your power meters good?
Even a Bird may have several percent error. Are the internal Dentron current
and voltage meters good? Is the your rig driving the Dentron properly or is
the input mismatched? What band was this on? The Dentron suffered from poor
tank component placement and poor component value choices on several
bands..the efficiency was quite a bit low on 160 and 80 and 572 tubes

"fall
apart" above 15 meters and loose performance quickly.

The most you could hope for is around 50 watts of drive for 700 watts output
with 1700 volts of full load voltage. The loss of gain (yours takes 100 watts
instead of 50) is probably more due to the layout, design, and the low operating
voltage than a defective component.

From: little@iamu.chi.dec.com
Message-ID: <3lpr7q$71f@jac.zko.dec.com>
Source record: 219135

I am in the midst of purchasing a used FT-1000D and in calling Yaesu to find out about the radio, the technician said there was a factory update that replaces 10 or so diodes in the front end. The radio was manufactured in 1991 I think. Has anyone had this modification done or do you know any of the details about why this modification is being performed by Yaesu? The only cost mentioned was a required front end alignment for about $30 (and I'm guessing shipping, although that wasn't mentioned.)

>supply for regulation problems. Any other ideas or guidance appreciated.
>--

Steve,
The HW-101 had a problem with the aluminum chassis where it came
into contact with the copper and solder (tin/lead) on all of the
circuit boards. It tended to build up corrosion along the points of
contact.
This would cause a host of problems from AC hum in your audio to chirp
to unwanted oscillations. What you have to do is remove all of the boards
and clean them with a stiff brush (don't use a metal one unless you are very
careful to check for pieces of the brush left behind) and some 91%
isopropyl alcohol. You can get this stuff at your local pharmacy. The
regular "rubbing" alcohol has a blue label and the 91% stuff has a red
label. Good Luck

2458. Re: Own a Kenwood 733 dua

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-03 00:00:00 UTC
From: ej.johnson@digcir.cts.com
Message-ID: <950403160023184@digcir.cts.com>
Source record: 219140

BA< I own a TM733 and it seems to work fine. I wish it had some of the
BA< features of the Yaesu, like a lighted mike keypad. It also has a
BA< strange behavior where it drops carrier right before sending DTMF
BA< codes from the DTMF memory. I took it to Kenwood and they said,
BA< "Sorry, that's the way it works - tell your repeater owner to change
BA< his timing for phone patches".

BA< Other than these minor things, I am pleased with the radio. Kenwood's
BA< attitude is not reassuring so I hope not to have to service it soon.

BA< 73, Bob, AA9MI
Bob, I have a 733 also I never noticed this problem my self, I have
found that when you call kenwood sometimes the service rep doesn't
understand the problems you are explaining If you call back and talk
to a different rep you may get a different answer!

I have the Yaesu earpiece mike and like it very much. The mike is a seperate unit (about 1 inch x 1/4 x 1/4 inches big) with a PTT switch and the earpiece is of the "bud" variety.

I have used VOX mikes before, but the problem is that if you speak to someone else or utter an explative you also broadcast it.

2463. SOMMER 507 vs. 707 ???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-03 00:00:00 UTC
From: kham@halcyon.com
Message-ID: <kham-0304952247160001@blv-pm1-ip12.halcyon.com>
Source record: 219145
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

To owners or those familiar with these antennas: I am considering both of these antennas and have come up with a few questions:

1. Even the manufacturer seems to recommend the 507, even though its gain is lower that that of the 707. What is your opinion?

2. The manufacturer seemed to indicate that the angle of radiation on the 707 would be lower than the angle on the 507 and therefore it was more suited for far off DX as opposed to stateside QSOing. What is your informed opinion?

3. The manufacturer indicated that the 507 would be better for close-in and DX operations (varied use) than the 707? Your ideas? He also felt that it was a better all around deal when you consider the cost of antenna, rotor, etc.

4. I'm used to believing that if you pay more you get more, but they seem to be saying the opposite. In your opinion, with a 60 ft crank up tower in Seattle, which would be better as THE ONE antenna I am allowed to put up?

Thanks for your time!

Hi, and thanks for reading this.

I have recently aquired a second-hand Standard C520 Handheld,
which I'm very pleased with. Unfortunately though, thre is no longer a UK
importer for Standard equipment, and no one here appears to hold spares
or accesories (please correct me if I'm wrong - I hope so). Anyway, I'd
like to get hold of a spare CBT151 battery case (and perhaps a nicad pack
if the price is right), so if anyone knows of a company (anywhere in the
world) who stocks Standard bits, I'd appreciate if you could let me know.
A company which I could contact on the net would be even better.

Thanks,
Rob

BTW - If anyone has any of these bits which they want to sell second
hand please let me know.

Hi,

Mizuho has had a SSB 2 meter HT for about 10 years. I don't know if they
still make them as they have been changing their lines lately.

You should check the Japanese CQ magazine as I don't think Mizuho has any
North American dealers (again). Dave WE6L/Phoenix

Last I heard, the info on the unit was as follows:

HT-750 69,000 yen 40/15/6 meter SSB/CW handheld xcvr
The 40, 15, and 6m antenna coils were priced from 2500 to 4500 yen, each.
The thing is REALLY heavy ... I held one a few years ago and it felt like
I was holding a 2m HT from the early/mid-70s.

>Neil (N0PFZ)

Neil:

I have always found Icom's repair department to be fair and reasonable.
I had a speaker fail in a M-11 (Marine HT) which they repaired without
charge while the unit was still under warranty. Several years ago they
repaired a R71A receiver power supply which was intermitent (an annoying
and sometimes difficult problem to pinpoint) in a timely manner.

ICOM America

Just curious on the best way to go. Obviously an internal filter helps,
but my logic is to try a DSP first. If you're CW only, then you only
want the narrow (250 Hz) filter, but if you work SSB and CW wouldn't
the DSP be the first purchase?

Comments?

2485. handheld 2M SSB

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-04 00:00:00 UTC
From: "Murray S. Tucker" <mtucker@freenet.calgary.ab.ca>
Message-ID: <Pine.A32.3.90.950404011142.35479B-100000@srv1.freenet.calgary.ab.ca>
Source record: 219068

Does anyone know of or remember who made a 2 Meterhandheld
that was capable of SSB? I seem to recall about 8
years ago there was a handheld available that had SSB.
Anyone have any info? Thanks.

2486. Question re: PB32 battery pack

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-04 00:00:00 UTC
From: richardl@adobe.com
Message-ID: <1995Apr4.233334.29287@adobe.com>
Source record: 219069

I have a question regarding the PB-32 battery pack which came with my TH79A(D). There are three metal tabs always visible at the bottom of the battery, two of which are marked with a plus sign and one of which is marked with a minus sign. I used a voltmeter to measure the voltage between the minus and the positives and it is about 0.2V for either one. When I take the battery out of the radio there are two unmarked metal tabs at the top of the battery case and the voltage between these two is the expected 6.0V. Does anyone have any idea what the tabs on the bottom are and why the voltage across them is so low?

Recently, I have been given 2 GE Custom Executive Mobile Radios. Does anyone know where I can obtain some schematics for these (and if they can be retuned for 2 meter work. Currently they are for 155.825 Mhz...) I would like to use these for our local packet BBS work (if we can, since they were free it sure would be nice!)

I recently purchased a used FT-11R (it's in the mail). I was wondering what the general consensus is on this particular HT? I know I should have asked this sooner. This is Yaesu's best selling 2 meter HT at this time.
All I know about the radio is that it is tiny and puts out 1.5 watts with the standard battery/ 5 watts with optional pack.
thanks
-dan

>
>Gary
>--
>Gary Coffman KE4ZV

Gary,

High quality modern NiCad batteries do not exhibit memory effect. Memory effect occurred as you described by long term cyclical use of some portion of a cell's capacity.

What is still a battery management issue is "voltage depression" which is caused predominately by over charging. Over charging is defined as continuing to charge a cell after it has reached full capacity. This causes cell heating (and in extreme cases out gasing and loss of electrolyte) which in turn creates the "voltage depression" effect. Typically, the actual capacity still exists, however, it is provided at a lower cell voltage which fools low battery detection circuits that have fixed voltage threshold.

Thanks for the opportunity to comment,

Dave KB7ZEK

>problems with. The output is kind of low and and the plate current seems a
>bit too high. With 100W of drive it puts out about 600W. Plate voltage seems
>ok (1700 - 2200 volts) but with the key down it's running at about 800 mA.

Gee Fred I don't know what you expected! That doesn't sound too bad. The gain
of the 572's is identical to 811A's (at the same plate voltage). So if the
loaded plate voltage is below 1500 volts that output power is acceptable. If
the loaded (operating) plate voltage is 1700 volts at .8 amperes that's 1360
watts input. That's less than 190 watts per tube dissipation, and probably 45
to 50% anode efficiency (remember some efficiency and power is lost in the
tank). That seems acceptable for the technology used in the 572 tube and that
particular amplifier design.

>Max
>current for the 4 572Bs should be around 1.0 amp. The tubes are old but seem

>ok and when I swap in a new, known good tubes I get the same results.

Tubes must be good!

>What are normal current values for a given drive/output level ? Any ideas
>about what to check ? I've got a schematic but that's about it.

Depends on lot's of things...accuracy of meters, are your power meters
good?
Even a Bird may have several percent error. Are the internal Dentron
current
and voltage meters good? Is the your rig driving the Dentron properly or
is
the input mismatched? What band was this on? The Dentron suffered from
poor
tank component placement and poor component value choices on several
bands..the efficiency was quite a bit low on 160 and 80 and 572 tubes
"fall
apart" above 15 meters and loose performance quickly.

The most you could hope for is around 50 watts of drive for 700 watts
output
with 1700 volts of full load voltage. The loss of gain (yours takes 100
watts
instead of 50) is probably more due to the layout, design, and the low
operating
voltage than a defective component.

Handheld or base unit? I'd go with a handheld. Either the AOR AR8000
(most bells & whistles) or the Yupiteru MVT7100 (best RF performance).
The AR8000 goes for around $569 to $649 and the MVT7100 goes for around
$500 to $600. Since money is no object, buy me one of each! :-)

>and zap the little bugger about 5 times and then recharge in the normal way.

Gary, zapping a NiCad can sometimes burn off a dendrite that is shorting
a cell, but it won't do anything for voltage depression (aka memory effect).
The best thing to do about voltage depression is to avoid it. You can do
this by *not* discharging the battery to the same point each time, and
by *not* excessively overcharging the battery. If you do get a voltage
depression effect *and* you can access the individual cells in the pack,
then discharging each cell *individually* to zero volts, and then giving
a full slow charge to the cells, will "erase" the "memory". This will
reduce the life of the battery, so it shouldn't be a routine practice.

The best way to deal with "memory" is to not cause it in the first
place. Make it a practice to vary when you change and recharge
packs on your radio. Don't always run it all the way down, and
don't always change it after a fixed number of hours of use. Try
to recharge the battery when it is in some random state of charge,
and use a charger that will detect the "droop" when the battery
just reaches full charge and *stops* charging at that point.

Gary

Message-ID: <Greenberg-050495131742@greenberg-t.aero.org>
Source record: 219003

Is this a case of "you get what you pay for"? I noticed RS has the 202 on sale for 189.00, or from U.S. Radio mail order for 169.00. I'd like any comments on this HT. Is it a good product for the money, or a piece of junk. I've seen some of the postings on batteries and power supplies for the rig, but in this price range, would you buy it knew (with an extended warrenty) or buy a used name brand (Knwd, Icom, or Yaesu)? All comments and opinions appreciated.

2504. WANTED: Copy of Diamond X-500NA instructions

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-05 00:00:00 UTC
From: cyamamot@kilroy.jpl.nasa.gov
Message-ID: <3lstf3$d58@lo-fan.jpl.nasa.gov>
Source record: 219079
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.swap

Greetings,

After years of waiting for a location and opportunity to put up my Diamond dual band base antenna, I have a chance in about 1.5 weeks to do so.

Unfortunately, during my move I lost the 2 or 3 pages of instructions for putting up this antenna. This model maybe similar to the X-510NA but I'm not sure. I do know from visual inspection I have the 'N' connector fitting.

If anybody out there has instructions for this 3 year old model from Diamond, I would greatly appreciate a clear, clean copy of it. Please email me for my US Postal address so I know you're sending it and we can work out the fees (hopefully not more than $3.00)

Thanks in advance & 73's
- Cliff

2506. DSP-59 to 59+ upgrade for $100

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-05 00:00:00 UTC
From: hamilton@BIX.com
Message-ID: <hamilton.797043471@BIX.com>
Source record: 219081

Around the end of '94, I bought a used DSP-59 from a fellow who'd bought a new DSP-59+. The price I paid, $150, certainly seemed fair enough. But I was pleased to learn this week that I could get the DSP-59 upgraded to a DSP-59+ for only $100, making that original purchase even more fair than I'd expected. I'd called Timewave hoping just to buy a new manual, so this was a very pleasant surprise. For the $100, they claim they'll basically throw away everything you send them and rebuild it almost from scratch. When they're done, they claim the result is totally indistinguishable from a new DSP-59+. New front panel, new software, new DSP chip, new rear panel, etc., etc.

Now that's an upgrade policy and pricing scheme I like! Timewave is certainly to be commended, it seems to me.

>kept track I would appreciate your input. On sale the thing
>is less than half the price of a Kenwood CW filter.
>
>Opinions good or bad are welcome. Tnx de Jerry

I my opinion it is good value for those who need it. It features are:

1. sharp passband filters (useful for rigs with hum and/or hiss)

2. perfect heterodyne removal

3. sharp CW filters but with some distortion. Day and night
difference for rigs without the CW filter, less so
otherwise

4. built-in speaker

I believe the distortions are a result of the 8-bit design. No one can
expect 16-bit for $80.

2511. Re: Looking for Mods for HTX-202 or will it blow up?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-05 00:00:00 UTC
From: dave@eram.esi.com.au
Message-ID: <3lt27a$b74@eram.esi.com.au>
Source record: 219086

It's quite simple to modify an HTX-202:

1) Carefully suspend radio upside-down by the battery pack.

2) Slide out the radio portion, letting it fall to the floor (you won't
be needing it again).

3) Slide in the top half of an IC-02A or similar.

4) Turn right way up again.

You have now successfully modified your HTX-202.

In article <3li8at$gcc@news.primenet.com>, shade@primenet.com (Shade) says:
>
If you are looking for a 2 meter HT I highly recommend the ICOM 2GAT.
It is a rugged HT with the ability to output 7 watts with a 13.8 Volt
battery. I have had great luck with mine. I had to use it as a
substitute for my base station for several months. Again it worked
fine but it was somewhat awkward using it on a desk. It is a full size
HT however.

I also have the ICW21AT dual band HT. (I think ICOM replaced it with
a similar version with a detachable front panel. Not sure of the model)
The radio has a bunch of features. You'll probably only end up using
25% of them. It does have 2 undocumented features that are worth
mentioning:

1) It has continuous receive from 50Mhz to 999.999 Mhz. With the right
antenna if works fine. I have the backdoor mod if anyone needs it.
2) I also have the mod for crossband repeat. This seems to be a fairly
standard feature with mobile dualbands but I'm not sure about HT's. It
works too!

Again this radio works great. I've used it in my truck but it
was awkward especially when you're trying to change frequencies. It
does have a big front panel however. The only
negative thing is I don't recommend the ICOM HM-75 speaker mike. It
sounds like it's popping with every syllable.

I have also heard good reports about the Radio Shack HT's. By the way
they use the same accessories as ICOM.

Let us know what you decide on.

>

Hi Murray,
Yaesu makes a line of portable VHF multimodes. They are about the size of a VHF mobile rig, have a shoulder strap, and take a clip on battery pack or amp. Even comes with a rubber dummy. This is about the closest to a SSB handheld that I know of. The FT290 is the 2 meter version. It goes for about US $550. They also make a 6M and 70cm version. I have the 290. It's a neat little radio.
Also, Tokyo Hi Power or Mizuho(?) may have something, although they don't market it over here.

>That's for a shorted cell, not nicad memory.
>
>Andy
>
You're correct Andy, but typically fusing a dedrite that has grow from
plate to plate does not work very well due to contamination caused.
Effectively, the short will typically return.

The dendrite growth is caused, primarily by reverse current. That is,
current forced to flow through the cell from neg to pos when the cell is
discharged. This current is sourced by other cells in a battery that
are not yet discharged. This is overcome by matching cells in a battery
(in terms of capacity) which results in all cells in a battery becoming
discharged at the same time. This also the reason for discontinuing use
at 1 volt per cell because in a pack up to say 6-7 cells, the loss of
volt contributed by one cell can be distingished from all cells at the
end of capacity voltage (approx 0.9 volts). Also at 0.9-1.0 volts, less
than 10 percent of capacity remains anyway.

Thanks for the opportunity,

Dave KB7ZEK

I am looking for schematics for the serial interface card (IF-10C?) that goes in a Kenwood TS-140. (not the RS 232 level conversion cable) Now that most people have PC's, Kenwood has quit manufacturing this board. I have the 8251A and the 4040 chips that go on this board and have an idea of how they should be wired up but would feel more comfortable if I knew for sure. I can receive e-mail at bofstie@mnpower.com. Thanks from KB0PDO.

2519. TS-430S PLL Unlock?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-05 00:00:00 UTC
From: dnewkirk@arrl.org
Message-ID: <1995Apr5.132418.16479@arrl.org>
Source record: 219094

A friend of mine has a TS-430S transceiver that has begun to exhibit intermittent receive operation. (Dunno about transmit; his current situation makes him SWL-only for now.) Because he's a kilomile away from me, I can't easily get my hands on the radio for a quick look-see. (We'd also like to avoid paying for bench time at a service center for the obvious rea$on.)

I recall having heard that one or more of the TS-430's phase-locked loops tends to start having unlock problems as the radio ages--a condition that I recall having heard stems from close-to-the-edge loop design and/or alignment drift. I suspect that this may be the case with my friend's TS-430S because the problem occurs only on certain bands--as if a particular VCO/loop is involved. (Had I the radio right here, I'd work through the service manual to check the VCO/PLL operation, and/or confirm the presence of the VHF VCO signals with a general-coverage VHF receiver.)

I'd appreciate hearing your suggestions, anecdotes and experiences with/about TS-430S receive intermittency.

Thanks and 73,

David Newkirk, WJ1Z

Very hard to get new or used ones. Instead, try International Radio and
Computers Inc of Florida. They own the Fox-Tango line of crystal filters
and produce a drop in replacement for the original Kenwood filter. They
might even be better than the Kwd version. However, they are not cheap.
Check out QST for the address and phone number. They advertise regularly.

Bill:

Right now, Radio Shack has their 2m HT (HTX202) on sale for $189. This is an excellent little radio and you can't beat the price. I've had one for a couple years and I had really enjoyed it.

Just an observation, but be sure to KEEP the weight provided by the
original keyer base... alone, the weight of a wooden base will not
provide NEARLY enough stability while keying.

Bill, I have 2 Kenwood TH-22s and one TH-79. The 22 gives you 3
watts out and is nearly the most compact, with the FT 21? being the
smallest 2 M HT, with 1.5 watts. It is more handy and pocketable than the
79, and I would recommend it highly.

Dave, AB7FV

: 73s Steve, WA6TAF

Steve,
I'd recommend the HTX-202 without question. I purchased mine back
in OCtober of lasty year and haven't had ONE problem with the rig. VERY
STURDY, excellent intermod rejection (maybe the BEST of all HT's), comes
with a ni-cad pack AND a "AA" pack. Icom extras fit it (speaker mics,
packet cable from MFJ). The recieve audio is excellent and I've recieved
nothing but great reports on my audio with it. If you get it and get Radio
Shacks speaker mic replace the resistor with a 10k resistor, the
transmitting audio is lousy with the stock resistor. I usually don't
recommend extended service plans but in this case get it. IF you drop it
off a cliff, off a building, etc. your covered. I'm very happy with mine
and may buy another since there on sale again.

If you are modifying the TH79 EITHER cut the green wire OR cut the diodes.
Do not do both. The green wire gives you extra tx for MARS/CAP, the diodes
open it up wide for TX.

Best,
Peter, KC1QF

2532. Need TX MOD info for Alinco DR-M06 6 meter. Will Pay $30

I am working on an all band transverter and need a 45.75 MHz IF. I recently purchased an Alinco DR-M06 radio for this sole purpose and have not been able to locate the modification information for it. I was told from a very respectable source that the radio was capable of transmitting in this frequency with reduced output. I am willing to pay $30 for the modification information for this radio. The radio currently receives from 40 to 60 MHz after turning it on with the Call button pressed.

I recently received some e-mail from some guys in England explaining how to perform the mod. Unfortunately, the info was not specific enought on which pads needed to be jumpered. If you have any info I would really appreciate if you can get in touch with me via e-mail or this newsgroup.

Tony Clark (jayant@epix.net) wrote:

: I would like to know the BEST available scanner out there....Money is no
: object.

Most "scanners" are VHF/UHF wide coverage receivers of very poor
performance with processor controlled tuning used to find signals.

If performance is an issue, you are better looking for a decent
VHF/UHF receiver - almost all of them have have massive arrays of
memories and scanning functions, anyway. I suggest you look seriously at
the ICOM R9000. This is an impressive 30kHz to 2000MHz receiver that is
also used by a variety of spectrum management agencies around the world.
This is certainly the top end of the amateur/commercial market.

Without some detail on what you want to do, "Best" is guesswork

From: tonyz@rose.hp.com
Message-ID: <3m170p$g34@hpscit.sc.hp.com>
Source record: 219021

I have an old rack-mount cw transmitter made by the James Millen Co. It has a black wrinkle finish, an ammeter in the font mid-panel and this panel is about 4 inches high. There are two knobs to the left and right of the meter, labled 6L6 (xtal oscillator) and 807 (final amp) with a switch to the left of the 6L6 knob specifying xtal or vfo input. To the right of the 807 knob, another switch to switch between the 6L6 or 807 current. I would imagine this would be for the tuning of the plate currents. In back, along side the metal 6L6 and 807 tubes are plug in coils, etc. A ceramic connector at the left hand side front panel allows for plugging in an Xtal or a Vfo. On the right is the phone jack for a key.

Does anyone know what year this was manufactured? There is nothing to identify a model number. Only a tag inside the chassis indicating that it met FCC requirements for an amateur transmitter and of course on the outside there is a metal tag that has a serial number and 'James Millen Co.'.

Thanks for any info.

Tony

2546. Need source for molex power connectors (TS-120)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-06 00:00:00 UTC
From: mikef@microtech.com
Message-ID: <3m1qdl$it6@aimnet1.aimnet.com>
Source record: 219029

Does anyone have a source for molex style connectors? I've borrowed a friends TS-120 and would like to have a number of different connections made up for different locations (work, boat, car...) but I can't find a source for the power connector. The connector is a six-conductor of which four are used. I need the male side. It has three round sections, and three D-shaped sections. Looking at the connector end on, the layout is like this:

```
=
O D O
D O D
```

The = is a small clip on the connector. The D shaped sections all have the flat parts in different orientations. The one on top has the flat side toward the top, and the bottom ones have the flat side toward the outside.

Any sources would be appreciated, especially if they are in the SF Bay area.

Hello everyone,

I am looking for suggestions on a UHF Handheld radio. Right now I
am leaning towards a Kenwood as the speaker mics and headsets that I have
available to me are Kenwood. I don't want to have to go out and buy new
Accessories at this time.

What I need is a light weight and small UHF HT that is durable and
relaible. The transmit power is not really that big a concern as the range
of the operation will be fairly short.

Has anyone had any experience with the newer Kenwood UHF HT's?

This request or one simialar was posted here about a month ago but
the people upstream from the Internet Provider I am using had a few
difficulties about then and I may have missed any responses.

Thansk for any replies.

The HTX-202 has 12 independently-programmable memory channels,
plus one calling and three priority channels. It comes with
continuous tone squelch encode -AND- decode. Power output is
5 watts minimum (7w typical) with 12 VDC supply, 3 watts
@ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1
watt output. A power saver circuit with programmable 1/2, 1/4,
1/8, or 1/16-second duty cycle. Batteries are compatible with
larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories store any offset, and any combination of continuous tone frequencies.

Size is 65 x 117 x 37 mm. To put this in perspective, with alkaline packs on the 202 and my ICOM W2A, both are the same thickness. The 202 is maybe 1/4-inch wider (at widest part), and 1/16-inch taller (it's hard to compare because of the irregular shapes of HTs.) The HTX-202 does give the impression of being a "mid-size" HT until viewed up against something like the little W2A, which actually has three different "widths."

Supplied with Nicad battery, charger, 6-cell alkaline battery case, antenna, wrist strap and belt clip.

Now, the good stuff...

* True FM modulation (not phase modulation) for outstanding transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz, and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of downtown Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio

I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!!!!

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because we purposely limited coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end we could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to their usual Korean source for cheap gadgetry: MAXON. Maxon then built the HTX-202 for Tandy, under license from Icom. The HTX-202 is surprisingly sturdy, and well constructed, considering that Maxon's Quality Control has, in the past, been suspect.

Most HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well. If the Zener diode in the bottom-feed circuit is bad, only a 9.6-vdc pack or less will work. A minor headache at the very least.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

DESIGN FLAW: Some early production (S/N 2500 and down) radios had the NiCad Zener Diode located too close to the finals, causing final transistor failure when used on external DC with the pack in place. This was remedied in production, and Tandy will remedy under warranty.

Rob> Does anybody know of any reviews of this radio? Any info
Rob> would be greatly appreciated...

I am also new to Ham, currently studying for the Technician test.
While I don't have much hands-on experience with HT's, I have done a
little research on the HTX-202 and recently bought one. QST magazine
reviewed several 2m HT's in October 1992, including the HTX-202.
Other radios reviewed were: Alinco DJ-162TD and DJ-F1T, ICOM IC-P2AT
and IC-2SRA, Kenwood TH-28A and TH-225A, Standard C168A, Yaesu FT-411E
and FT-415. Here's an excerpt regarding the HTX-202:

The runaway leader in in-band receiver performance, the HTX-202,
Radio Shack's first-ever 2-meter hand-held tranceiver, does the
company proud. This rig has taken a lot of pounding on the air and
in other ham forums for its lack of receiver coverage outside the 2m
ham band - something that every competing radio provides - but the
benefit is a direct payoff in adjacent-channel selectivity and
two-tone, third-order IMD dynamic range. [...] What does this mean
to you? The HTX-202 is practically immune to the interference
problems so common in urban areas thick with VHF radio traffic.

[...]

Other points in its favor include its ruggedness, super-easy
programming and operation; loud, low-distortion receiver audio; and
clear, well-illuminated display. It's the only radio in the group
that comes with both an alkaline battery case and a NiCd battery
pack. Its instruction manual is also excellent.

[...]

The HTX-202's unlit keypad can be hard to read in the dark, and this is *not* a compact radio. [...] But therein lies the advantage: Though Radio Shack's accessory offerings are few, the HTX-202 is compatible with ICOM's large line of IC-2AT-series accessories.

For budget-conscious operators who value solid receiver performance and the ability to buy locally, and who don't consider the HTX-202's lack of extended receiver coverage a major liability, this radio offers solid value and good basic performance.

[...]

Only the HTX-202 includes a battery-charging indicator. This feature, insignificant as it may seem, made most of the evaluator's wish lists.

[...]

For thos who need only ham-band coverage and 16 memories, Radio Shack's $260 HTX-202, the second-least-expensive radio reviewed here, is another super value. Its receiver performance, standard extras, and high transmitter power (6 W at 13.8 V) make it best suited for occasional portable or mobile use and the best of this bunch for home-station operation.

Radio Shack had the HTX-202 on sale for $199 recently. I bought one on the last day of the sale, but I think they're back at $259 now. At that price, you might want to take a look at some of the other HT's on the market...

You might also send mail to brettb@cruzio.com. He is organizing a mailing list for the HTX-202 and might have some information for you.

Hope this helps you.

"Specialization is for insects."

From davev@atkc.comTue Dec 13 20:23:44 1994
From: Dave van De Kerk <davev@atkc.com>

A lot of the determiners of the "BEST" HT depends upon your goals.

Do you want a radio for use in a popular - perhaps crowded band? If so, choose the busiest local band. (Usually 2 meters)

What do you want to do with the rig? OK, send and receive, but send and receive what, and on what frequencies. If the answer is "I want to be able to send and receive on the police band and other

non-ham frequencies" then there are radios that can be modified
to allow you to do that. If your answer is "I want to send and
receive HAM stuff on HAM frequencies" then look for a radio that
works as a really good Ham unit, ignore any arguments about
transmit out of band/receive out of band capabilities.

Personally, I own two Radio Shack HTX-202 units. They're cheap,
they have a better transmitter than most of the expensive ones,
and they have a better receiver than any other 2m HT I know of.

a) They're cheap. About $180 mail order delivered to your door
from Marymac 800-231-3680. That's brand new, full factory
warranty, no tax, delivered to the door. (Think of it as
equal to about $165 plus tax. Now that is cheap!)

b) The transmitter is better. The transmitter uses true frequency
modulation. The audio tone is excellent. So good, it's characteristic.
I can usually guess whether someone is using one. They sound natural.
A lot of other units have characteristic distortions or buzz sounds if you
get used to them. I don't do packet, but people who do says that the
clean transmitter makes it a very good choice.

c) The receive is better. This rig is designed as a ham band rig
only. You can't modify it to send or receive out of band without
killing it. But, the receiver is REALLY tight. In areas where
there are a lot of TV stations or FM transmitters or pagers, where
other ham rigs with wide band receive are useless, the HTX-202 is
fine.

OK, it isn't the smallest, and there are ones with more features
and more memories, but it meets our needs.

Consider buying the optional warranty. It's like $40, and it
guarantees the radio for four years.

By the way, I don't work for Tandy or Radio Shack, and I never have.
I own one for me and one for the Mrs.. plus an old Icom 720A I use
for morse code.

>Ummm.... don't dendrites form during trickle charging?

Yes, this is really the same issue. The effect is really created when the
battery is at full charge for long periods of time. The dendrites form to
try to bridge the gap between the plates because of the voltage differential.
This can happen any time. The higher the voltage potential, the creater
chance they will form. The battery does not have to be charging for dendrites
to form, but they are more likely to form when a battery is trickle charged
for extended periods of time.

Mike,

No, dendrites are formed by reverse current. This typically occurs, in
practice, when one cell in a battery reaches zero before the others. If
the voltage of the other cells is relatvely nominal, the low battery
detection circuit can allow the powered device to continue to operate.
The current sources by the other cells amount to reverse charge current
in the depleted cell. This action causes dedrite growth.

Thanks for the opportunity to comment,

Dave

Hi. This is post for any of you out there who might wanna collaborate on writing a half-hour radio show. No, it's not for money. See, a while back I wrote a couple half hour scripts and I was trying to get radio stations interested in them, but nothing. Had to have a demo tape. Here's the deal. If you've got that kind of Monty-Python-vaudeville-absurdist-humor streak in you, and can lay your hands on some kind of recorder unit (like a 4 track), then I think we may have something. I'm not an actor, so if you fancy yourself one, or know of a couple guys you can round up, then voice them on tape, and I can copy and distribute the tapes. If a radio station doesn't bite, I'd like to send them around or sell them as kind of comedy albums. I've Always wanted to start a company like that. You know, comedy records. Not that this is starting a company (I'm as poor as a zinester, but for the worthwhile shtuffs, I'm willing to go without Ramen noodles and generic cola to save the money for this kind of thing), but I think if we work together, it can be done. (There's a market for everything.) You handle the recording, I'll handle the distribution; and we'll both think up the funnies. Okay? Even if you don't want to do an ongoing thing, just want to try 1, email me. I'm rarin' to do this!

2562. Re: Mobile transceiver recommendations requested

Eric Benoit wrote:

> How much would I pay for a HAM radio (used or new), basic, not too much
> $$$...

There are two basic kinds of ham set: HF and VHF/UHF. HF (high frequency) can provide contacts world wide given favorable atmospheric conditions. VHF (very high frequency) and UHF (ultra high frequency) provide mostly local contacts over ranges up to 50 miles or so (although some VHF frequencies can provide very long range contacts under special conditions). Used HF radios can be had for as little as $150, although more modern used HF sets go for around $400 - $500. New HF sets start around $800, and go up to $5,000 or more. A "typical" new HF set these days is around $1,500 - $2,000. Used VHF and UHF sets can be had for $150 and up, with new sets going for $300 - $1,000. A typical new VHF or UHF radio is around $400. Dual-band sets (VHF and UHF in one radio) go new for around $600 or so.

> And will it work in apartment buildings?

Lots of people do this successfully. It takes some doing, and results won't be optimal, but you can get on the air, make a lot of contact, and have a lot of fun even from an apartment.

As I'm sure you know, you need a license issued by the FCC to operate a ham set. You earn this license by passing a written test on regulations, procedures, and radio theory, and in most cases, a morse code reception test (although there is one license class that requires no code). For more information on becomming a ham, contact the American Radio Relay League in Newington, CT. Best of luck.

2570. KNWD TH-79A & IC304 HELP???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-07 00:00:00 UTC
From: thavens@wx2l.UScc.COM
Message-ID: <m0rxEWF-00092vC@wx2l.uscc.com>
Source record: 219036

Does anyone have a SERVICE manual for the Kenwood TH-79A? If so would you be so kind as to find whatever is referenced on the 'lock' function of IC304. Pin #19 is the Keyboard Lock on IC-304. This much I already know. I also know that the 'lock' switch on the HT switches between + VDC of some undetermined amount, and Ground.

What I need to know is:

1.) To Lock the Keyboard via pin #19 on IC304 what is required? voltage or ground, to activate the LOCK.

2.) What voltage is required, and is there a range?

I have a TH-79A that is very sick...;-) I have come a long way to restoring it...but the lock is LOCKED, and I can't get it to release...

I am willing to bypass the Lock switch, and hard wire it to whatever it requires to unlock....I just need to know what it is...

Please EMAIL me at: thavens@wx2l.uscc.com DON"T JUST REPLY TO THIS NEWS....

or call me at 609-451-7773 (home) or 609-247-0005 (work).

You don't say where your interest lies. HF or VHF ?

For 2m, how about the Kenwood 751 - good for FM mobile,
and also an adequate SSB / FM homebase.

My TS241e (FM only, 2m) has performed well for the last 2 years,
but the display is a bit fragile. It now has a tendency to
scramble or lose the display because of the crappy rigid connector
between the front panel and the rest of the cct..

2576. Automobile RFI problem, Help! again...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-07 00:00:00 UTC
From: brunelli_pc@delphi.com
Message-ID: <po8doKu.brunelli_pc@delphi.com>
Source record: 219042

Here is the dope on a problem with a mobile installation
in progress. I have posted before and my thanks to
all who responded and for all of their excellent advice.
None the less, i still have the problem! Here is the
update (he says, shaking the garage floor grunge from his hair)
on this most desperate of situations.

CAR = Isuzu Trooper II, 1991
Antenna = Outbacker Perth
Radio = Ten Tec Scout

The antenna is mounted on the spare-carrier, using a bolt-thru
hamstick mount. I have 2.5 feet of tinned braid running around
the coax, soldered to the PL259, and bolted to the door hinge.
This works! Nice ground strap.

I have done a substantial bit of RFI snooping in
my Isuzu Trooper. The problem is an s-9 white
noise while the engine is running. When i pull
the antenna from the mount, the noise disappears.
this is consistent with a radiated noise source.

My initial "AH-HA!" came when i pulled the fuel pump
fuse and the noise dropped, not all the way, but i could
live with s-3 noise.

BUT, I took a length of coax with a pl259 on one end and
the other end stripped back and "t"'d to act as a small
snooper antenna. I went through the whole vehicle and found
no noisy devices. I can put the snooper ON the ignition
wires with no appreciable noise. I can put the snooper on
the fuel pump, and on the power leads, and still not much of
anything.

BUT, the noise is heard at the s-9 level of i touch the center
conductor to the chassis of the vehicle. Actually, the chassis
hears pretty well! So the vehicle chassis would appear to be
acting as an antenna, and is just as noisy as the Outbacker.
Any Ideas?

> thanks
>-dan

Dan,
I have been working with an ft11r for a few months. It belongss
to a blind friend of mine and he likes the small size and the keybad
beeper. The upside , IMHO, is the size, low weight, bright display,
and decent keypad. The downside is the expense of the external power
adapter/charger. The unit with the little fan... It is an expensive
proposition to get this thing up to full power. And the trickle
charger is kinda wimpy. Personally (really) i like alot of flex
in how i get power to the rig, and nicad packs are not going to do
the job 100%. I run my th78a from gell cells, wall warts, my HF rig
supply, cig lighter, and solar pack, no sweat... just plug it in.

Also, the ft11r that my friend has lost its memory four times in
three months due to low batt conditions, and yaesu has in effect said
"tough luck". ouch! I guess it doesn't happen to all ft11's

For sale;

ICOM R1, including BP84 (1000 mah) pack, bottom cap (for running
on internal battery), wall wart (charger), soft case (virgin
vinyl!), manual and duck antenna. Continuous coverage
500 Khz to 1300 Mhz - NO GAPS, 100 channels, AM/FM/WFM. These
sell for about $500 new - and the new ones have a 800-900 Mhz
gap that mine does not...

Price is $360, firm. I pay shipping via UPS or USPS (your
choice), payment by postal money order only. US buyers only
(sorry but my mail utility does not support resticting post
to US only).

> I recently purchased a used FT-11R (it's in the mail). I was wondering
> what the general consensus is on this particular HT?

Dan:

You made an excellent choice. I'm an HT nut and I've owned a lot of them. There is no small 2m HT like the FT-11R. The thing is packed with features and very intuitive to operate. I can do just about everything with little reference to the manual. It's a million times better than
the Icom 2ia or Standard C108 in its ease of operation, and has a great display.

I agree with the other message about the ridiculous price of the quick charger. But batteries aren't
too expensive, so just have enough of them to get by on the wall charger. There's a nice little leather
case that costs around $20 that is worthwhile, too.

Seems I do recal sometime back and do not remember where I saw it
that someone had moved one down in freq. to 2M. If it is not XTAL
controlled just tweak the local oscillator and RF amp and maybe try
to compress a coil or two if it won't move low enough.

My favorite project used to be to modify an FM radio to tune about
120Mhz to around 170 MHz. de WB6THE

Gerald:

Unless you are just a hopeless penny-pincher, stay away from the Radio Shack filter. It's junk compared to the others available (like the TimeWave units), and you'll be dissatisfied and have to try to push it on to another cheap ham, who will offer you only $5-10. Then you will have lost $40 that you could have put toward an acceptable filter.

Have you had Yaesu replace them? They have a mod that replaces 10 or
so diodes in the front end with beefier diodes. The mod is free, but
they require that you pay for a front-end alignment (at least this is
what the tech told me), around $30.

Tony, what you have sounds like a Millen 90800. It was first advertised just before WWII. It's a close copy of a Don Mix design discribed in the Nov 1940 issue of QST and in the 18th edition ARRL Handbook. The big sales were right after WWII into early 50's. At some point in the early 50's Millen redesigned the rig to eliminate TVI problems. The new version was completely shielded and (I believe) used a 6146.

If you decide to try putting it on the air you'll have to deal with TVI and also be careful with the coils, they both have B+ (up to 750 Volts) on them. Mine even had B+ on the knob shafts.

73, Niel - WA5VLZ

:

Regarding the Hamtronics TA901 902-928MHz exciter, it is available
only in assembled form, and Hamtronics will want you to specify an
operating frequency so they can tune it for you. Also, it's rated
for 1/2 Watt continuous power. The board is rather tricky to adjust
without a spectrum analyzer, and following the "alignment" procedure
could land you outside the ham band. Otherwise, they seem to work
OK. There is also some room for improvement in its operation by
making circuit modifications.

From: carols9616@aol.com
Message-ID: <3m7aom$8ee@newsbf02.news.aol.com>
Source record: 218981

I received my ticket in the mail just this week and have yet to operate and have no equipment. But I can afford to spend some dough. I have a no code tech license and plan eventually to upgrade. I don't know where to begin in terms of what rig/antenna to buy. My real interest is in working DX fone, since I have a big mouth. I would appreciate any advice on what to buy. given the restrictions of my new license and goal to upgrade.

Thanks, Bob
N3UYE

2599. 219-220 MHz Radio Mods?

I remember an article in QST many years ago that described the mod for this
reciever.

2602. RS HTX 202 -- Good Price

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-08 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.12161.7583.0NFB9D5E@woodybbs.com>
Source record: 218985

Subject: RS HTX 202 -- Good Price or.....

>>Is this a case of "you get what you pay for"?
>>I noticed RS has the 202 on sale for 189.00, or from U.S. Radio mail
>>order for 169.00.

No - the HTX-202 is a case of "You get a lot more that what you paid
for!"

The HTX-202 has 12 independently-programmable memory channels, plus one
calling and three priority channels. It comes with continuous tone
squelch encode -AND- decode. Power output is 5 watts minimum (7w typical)
with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power
setting provides 1 watt output. A power saver circuit with programmable
1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with
larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the
scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories
store any offset, and any combination of continuous tone frequencies.

Supplied with Nicad battery, charger, 6-cell alkaline battery case,
antenna, wrist strap and belt clip. Features include:

* True FM modulation (not phase modulation) for outstanding
transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are
independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective
paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences
for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with
programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz,
and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or
16 seconds.
* Multi-function scanning lets you scan standard memories,
priority freq. memories, or a frequency range. Resume can be
after 10 seconds, when carrier drops, or remain on channel
(don't resume.)
* Transmit timeout - if you frequently time-out your local
repeater, this circuit will stop transmitting after a preset
delay (30, 60 or 120 sec.) and sound a beep. In effect, it
forces you to reset the repeater before the repeater times out.

Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

From an Owner: "I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of downtown Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!"

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because the HTX-202 is purposely limited in coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end RS could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to MAXON, a Korean entity. MAXON built the HTX-202 for Tandy, under license from Icom. The HTX-202 is sturdy and well constructed.

MISCELLANEOUS NOTES: Some HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

I have an ICOM 260A all mode 2 meter transceiver that doesn't work in the CW mode. Works fine on FM and SSB but no output on CW. I have contacted ICOM and they have technical info on this radio. I would like to use it on SATCOM low orbiting birds. If there is anyone out there that can help I would appreciate it. I have a schematic but no voltage references.
Fred W3RET < FREDCLEPP@aol.com

2611. RE: ICOM T21A or 2GXAT/HP?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-09 00:00:00 UTC
From: AE85%NEMOMUS.bitnet@ACADEMIC.NEMOSTATE.EDU
Message-ID: <09APR95.10022065.0100.MUSIC@NEMOMUS>
Source record: 218902

I have an ICOM T21A and a friend of mine has a 2GXAT. They have
each been modified for extended rx. The 2GXAT will display from
about 100 to 200 on display, but below the aircraft frequencies,it
doesn't seem to actually receive anything. Same for above about 170.
My T21A will display about 10-999 Mhz. The lowest I have actually heard
anything is on a nearby FM 50,000 watt station on 94.5 Mhz. It will do
ok on 115-170 range although sensitivity isn't very good above about
160 mhz (may be fault of antenna). It also seems to rx ok 420-480 or
so. I have only picked up cellular once when the bag phone was about
10 feet away. That is the only thing I have picked up about 500 mhz.
Hope this helps. I have heard there is now an S21A ICOM, but I have
no idea what it is. Good luck.

Message-ID: <1995Apr9.134558.17558@gsm001.mendelson.com>
Source record: 218903

Scott Richard Rosenfeld (ham@wam.umd.edu) wrote:
: HTx-202/404 batteries have the same form factor as Icom BP-x batteries.

: The Icom BC-35 charges the BP-x series batteries.
: Can it charge the HTX-series batteries?

I do it all the time, but the BC-3x series (Bc-30, bc35) will only charge it on the low rate setting. The chargers have 3 rates, and if I remember correctly they are are 16ma, 80ma, and 600ma. The micro switches adjust the charging rate.

These batteries DO NOT have an an internal safety switch, so charging them at the high rate WILL damage them.

A better charger to use is the Mastercharger I from W&W associates (or equivalent). This type of charger uses a pulsed charge, so the batteries do not heat up to the boiling point.

Buying BC-3x chargers used is not a good idea. I have gotten both a bad BC-30 and BC-35 that way. The BC-30 looked great on the outside, but was toast on the inside. The BC-35 was cracked, but supposed to work. Between the two, I now have a working BC-35 with that claims to be a BC-30. :-) It only took me 3 hours and a lot of soldering. These chargers sell new for $75.

My XYL (N3SPZ) and I run our HTX-202's from ICOM BP8's. They last longer, although bigger, and charge quickly in the BC35. My son (KB3BGD) got the radio shack batteries to run his ICOM IC-03at.

73,

Geoff.

From: kmiller@wimsey.bc.ca (Kenneth Miller (Consultant))
Subject: For Sale Yaesu FT-980 CAT

I have a approx 6 year old Yaesu FT-980 CAT for sale. This is an excellent HF
rig with both CW and AM narrow filters and the Yaesu matching desk mike. The
rig also has built in a general coverage receiver. Price is $1,100.00 (CDN) or
$800.00 (US).

Contact me at either kmiller@wimsey.bc.ca
or
voice mail (The Modeling Group/DSS) (604) 275-7747

Subject: I wonder...a dumb question

Eric Benoit wrote:

> How much would I pay for a HAM radio (used or new), basic, not too much
> $$$...

There are two basic kinds of ham set: HF and VHF/UHF. HF (high frequency)
can provide contacts world wide given favorable atmospheric conditions.
VHF (very high frequency) and UHF (ultra high frequency) provide mostly
local contacts over ranges up to 50 miles or so (although some VHF
frequencies can provide very long range contacts under special
conditions). Used HF radios can be had for as little as $150, although
more modern used HF sets go for around $400 - $500. New HF sets start
around $800, and go up to $5,000 or more. A "typical" new HF set these

days is around $1,500 - $2,000. Used VHF and UHF sets can be had for $150 and up, with new sets going for $300 - $1,000. A typical new VHF or UHF radio is around $400. Dual-band sets (VHF and UHF in one radio) go new for around $600 or so.

> And will it work in apartment buildings?

Lots of people do this successfully. It takes some doing, and results won't be optimal, but you can get on the air, make a lot of contact, and have a lot of fun even from an apartment.

As I'm sure you know, you need a license issued by the FCC to operate a ham set. You earn this license by passing a written test on regulations, procedures, and radio theory, and in most cases, a morse code reception test (although there is one license class that requires no code). For more information on becomming a ham, contact the American Radio Relay League in Newington, CT. Best of luck.

Subject: Kenwood IF-10C Schematics Wanted

I am looking for schematics for the serial interface card (IF-10C?) that goes in a Kenwood TS-140. (not the RS 232 level conversion cable) Now that most people have PC's, Kenwood has quit manufacturing this board. I have the 8251A and the 4040 chips that go on this board and have an idea of how they should be wired up but would feel more comfortable if I knew for sure. I can receive e-mail at bofstie@mnpower.com. Thanks from KB0PDO.

From: thavens@wx2l.UScc.COM (Tim R. Havens)
Subject: KNWD TH-79A & IC304 HELP???

Does anyone have a SERVICE manual for the Kenwood TH-79A? If so would you be so kind as to find whatever is referenced on the 'lock' function of IC304. Pin #19 is the Keyboard Lock on IC-304. This much I already know. I also know that the 'lock' switch on the HT switches between + VDC of some undetermined amount, and Ground.

What I need to know is:

1.) To Lock the Keyboard via pin #19 on IC304 what is required? voltage or ground, to activate the LOCK.

2.) What voltage is required, and is there a range?

I have a TH-79A that is very sick...;-) I have come a long way to
restoring it...but the lock is LOCKED, and I can't get it to
release...

I am willing to bypass the Lock switch, and hard wire it to whatever
it requires to unlock....I just need to know what it is...

Subject: Mobile transceiver recommendations requested

You don't say where your interest lies. HF or VHF ?

For 2m, how about the Kenwood 751 - good for FM mobile,
and also an adequate SSB / FM homebase.

My TS241e (FM only, 2m) has performed well for the last 2 years,
but the display is a bit fragile. It now has a tendency to
scramble or lose the display because of the crappy rigid connector
between the front panel and the rest of the cct..

From: mikef@microtech.com (Michael A. Fallavollita, Ph.D.)
Subject: Need source for molex power connectors (TS-120)

Does anyone have a source for molex style connectors? I've borrowed a
friends TS-120 and would like to have a number of different connections
made up for different locations (work, boat, car...) but I can't find a
source for the power connector. The connector is a six-conductor of
which four are used. I need the male side. It has three round sections,
and three D-shaped sections. Looking at the connector end on, the layout
is like this:

=
O D O
D O D

The = is a small clip on the connector. The D shaped sections all have
the flat parts in different orientations. The one on top has the flat
side toward the top, and the bottom ones have the flat side toward the
outside.

Any sources would be appreciated, especially if they are in the SF Bay
area.

Subject: radio show

Hi. This is post for any of you out there who might wanna collaborate on writing a half-hour radio show. No, it's not for money. See, a while back I wrote a couple half hour scripts and I was trying to get radio stations interested in them, but nothing. Had to have a demo tape. Here's the deal. If you've got that kind of Monty-Python-vaudeville-absurdist-humor streak in you, and can lay your hands on some kind of recorder unit (like a 4 track), then I think we may have something. I'm not an actor, so if you fancy yourself one, or know of a couple guys you can round up, then voice them on tape, and I can copy and distribute the tapes. If a radio station doesn't bite, I'd like to send them around or sell them as kind of comedy albums. I've Always wanted to start a company like that. You know, comedy records. Not that this is starting a company (I'm as poor as a zinester, but for the worthwhile shtuffs, I'm willing to go without Ramen noodles and generic cola to save the money for this kind of thing), but I think if we work together, it can be done. (There's a market for everything.) You handle the recording, I'll handle the distribution; and we'll both think up the funnies. Okay? Even if you don't want to do an ongoing thing, just want to try 1, email me. I'm rarin' to do this!

>found the CW mode acceptable and the SSB so so. If anyone
>kept track I would appreciate your input. On sale the thing
>is less than half the price of a Kenwood CW filter.
>
>Opinions good or bad are welcome. Tnx de Jerry

I my opinion it is good value for those who need it. It features are:

1. sharp passband filters (useful for rigs with hum and/or hiss)

2. perfect heterodyne removal

3. sharp CW filters but with some distortion. Day and night
difference for rigs without the CW filter, less so
otherwise

4. built-in speaker

I believe the distortions are a result of the 8-bit design. No one can
expect 16-bit for $80.

From: dnewkirk@arrl.org (Dave Newkirk (WJ1Z))
Subject: TS-430S PLL Unlock?

A friend of mine has a TS-430S transceiver that has begun to exhibit
intermittent receive operation. (Dunno about transmit; his current situation
makes him SWL-only for now.) Because he's a kilomile away from me, I can't
easily get my hands on the radio for a quick look-see. (We'd also like to
avoid paying for bench time at a service center for the obvious rea$on.)

I recall having heard that one or more of the TS-430's phase-locked loops
tends to start having unlock problems as the radio ages--a condition that I
recall having heard stems from close-to-the-edge loop design and/or
alignment drift. I suspect that this may be the case with my friend's
TS-430S because the problem occurs only on certain bands--as if a particular
VCO/loop is involved. (Had I the radio right here, I'd work through the
service manual to check the VCO/PLL operation, and/or confirm the presence
of the VHF VCO signals with a general-coverage VHF receiver.)

I'd appreciate hearing your suggestions, anecdotes and experiences
with/about TS-430S receive intermittency.

Thanks and 73,

David Newkirk, WJ1Z

> wbb@eecs.berkeley.edu

Bill, I have 2 Kenwood TH-22s and one TH-79. The 22 gives you 3
watts out and is nearly the most compact, with the FT 21? being the
smallest 2 M HT, with 1.5 watts. It is more handy and pocketable than the
79, and I would recommend it highly.

Very hard to get new or used ones. Instead, try International Radio and
Computers Inc of Florida. They own the Fox-Tango line of crystal filters
and produce a drop in replacement for the original Kenwood filter. They
might even be better than the Kwd version. However, they are not cheap.
Check out QST for the address and phone number. They advertise regularly.

Source record: 218906

Many of the 220 Mhz mobiles available can already go down to 219 MHz, but before you start worrying about putting a radio on the air in the new but _Not Yet Available_ 219 - 220 MHz band, read the new regs and / or ARRL bulletins that have been put out about it. This band segment is NOT for general amateur radio use. It is a secondary allocation for: "Point-to-Point Digital Links" ONLY. Any amateur emitter operating on this band segment must be coordinated to protect the primary _NON-AMATEUR_ users of the band.

Check with your regional frequency coordination organization or the ARRL for further information.

Good luck es 73's

I have FT-51R, and was wandering if there is a way to use it as a base unit, or does it always have to run off the battery?

And is there a way to clear one particular memory? I found no mention as to how to clear just one memory, or delete a character. If one entered one too many numbers in the DTMF auto-patch memory, for example 55589433 and I wanted to delete the last 3, or I enter a frequency and want to delete it, not mask it or skip over it.

Shai Kowitt - soon to receive my call letters in the mail.

> low?
>
> richardl

Richard:
The tabs on the top of the pack are where the radio gets its power from to operate. The tabs on the bottom are for a rapid charger to charge the pack. The reason no voltage is read is that they are diode protected. In case they were to come in contact with a metal object, this keeps your pack from shorting out. I had a friend who lost a pack on his Alinco DJ-580 when he laid it down in a shopping cart. The belt clip is grounded and the positive terminal touched the cart and ZZZZAAPP!! no more pack. He's a little oblivious at times, he did wonder what the WARM smell was for about 1/2 hour.

Source record: 218912

RL>Does anyone have any idea what the tabs on the bottom are and why
>the voltage across them is so low?

In order that you don't accidently short out the bottom (charging)
terminals and end up with a fire (possibly in your pocket), most
companies place a protective diode in SERIES with one of the charging
terminals (usually the positive term.) so you cannot short out the pins.
With the diode in series with the line you cannot measure voltage across
the terminals since the diode won't conduct in the reverse direction...
although you CAN charge the battery thru the diode since it will conduct
in its forward direction when the proper voltage (and polarity) is
applied.

I can offer you some insights into the FT51R at least. I purchased one last year for use in wilderness Search & Rescue work. It's performance has been very good. But the battery life required some attention. The model has numerous power-sucking functions which can be disabled. As factory-configured, the standard 9.6v (5watt) battery lasted 4 hours of mostly listening. But by turning off various beeps, boops and flashing lights the battery gets 6 to 8 hours. Using the automatic receiver power cycling feature can stretch that out a little as well. You can program different power levels for each channel. I set everyone to 20mw, and adjust up from there. Also, look to aftermarket suppliers for better battery deals. A 7.2v, 1500mahr unit from W&W is $60 rather than paying Yaesu $80 for less capacity!

I don't use the paging features, so can't comment there. I do like the wide-band receiver with which I can monitor Air Band and just about any thing else. The size is remarkable - real shirt pocket stuff. The only complaints I'd make are the cheap case and cheap belt clip. A metal belt clip would be nice for a heat sink-fin and greater security. Oh, and by disabling the channel "Naming" feature, you increase memory channels to 120 from 80.

I bought the service manual from Icom to repair my IC32AT. I found the schematic that came with the unit insufficient by itself. Icom charged me $35 for the manual. I'd advise going ahead and "buying the book". It's worth it. Making usable copies of all those fold-out pages is a real bear!

Yaesu sells a "charging cup" which the battery sets in to charge it. There's no provision for charging the battery thru the radio. I bought an extra charging cup for mine - $15 or $20 I think. Way over-priced! But not too many options if you like the radio. (1 cup and a slow charger comes with each radio). I fast charge using an after-market universal adapter. The sort that has 6 different plugs, several hundred ma rating, and switch selected voltage settings. BE CAREFUL NOT TO LEAVE THE BATTERY IN TOO LONG!

By the way: don't buy extra batteries from Yaesu. Very $$$$. Try after market suppliers like W&W or Periphex. My W&W battery was $20 less, and 3 times the amp-hours.

Need to get solder out of a small, plated thru hole eh? Here's a suggestion. What frequently works best for me is to blow solder out of holes. A small bulb syringe works well for this. Melt the solder from one side of the board, place the tip of the bulb on the hole and squeeze rapidly. Then just be sure to clean up the solder splash it causes. Learned this trick from a retired technician, but he used lung power to blow out the solder. The positive points are that heating of the board is minimized and it's very quick.

Sorry for the triple post buy I couldn't find the
post I am responding to. There had been some discussion
about where the HTX-212 was produced. Some wag posted
very authoritatively it was made by Motorola. Well folks
I dragged myself into the Shack and read the back of the
unit. "Custom manufactured in Korea for Radio Shack."
That pretty much settles where is is made. But by who? My
money is on Uniden. Now it may have a Motorola component
or two but I don't think Motorola made it.

Hallo !

I need some help to decide about buying a new SW-Tranceiver.

I like to get some comments about OMNI VI, JRC JST 245 or TS 850
Transceivers.

What is the better radio for digital modes (AMTOR, PACTOR) ?

What about RX quality ?

What about QSK quality ?

Thanks for your help.

2633. Isuzu Trooper RFI Solved!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-10 00:00:00 UTC
From: brunelli_pc@delphi.com
Message-ID: <pAw84FG.brunelli_pc@delphi.com>
Source record: 218916

I have found a solution to the RFI Problem in my Isuzu Trooper. The problem was an s-8 white noise while the car was running.
The noise was all radiated, as it dropped to s-0 when the antenna was removed. I found that pulling the fuel pump fuse reduced the noise for the 10-15 sec that the car remained running.

I had tried the capacitor filter across the pump leads near the pump with no real success. On friday i had N1QVE help me by listening to the rig in the car while i tried a few caps on the power leads to the pump. My cap assortment was a .47mF poly-film, 1mF poly-film, and 20mF Tantalum. All rated at 100V or better. The 20mF tantalum cap showed a reduction from s-8 to s-6. I know, big deal, but after what i had been doing i would take ANY reduction.

Now for the cool part..... While we were contemplating the reality of HF mobile with all of that noise, it dropped to s-2! that's right, S-2! This cap had been arounf for quite a while in my dad's (N1RYO) junk-box, and 20mF is kinda overkill anyhow, so the cap had to charge in order to do its noise supression. I now have no real white noise problem. BUT, i can hear the ignition noise that was buried under the white noise

Thanks for all of the input and i hope to work you on HF mobie soon.

73,
pete, n1qdq

PS, it takes about 90 sec to 2 min for the noise reduction to happen, so give it some time. I think that a 0.47mF cap would do as well but i will not replace the 20mF tantalum unless i have a reason.

Also! Tantalum caps are polarized! So pay attention.

And! I make no guarantee regarding the effectiveness, safety, or effect on your manufacturers warantee. If you are not sure what you are doing, get experienced help.

A lot. The original KW 950 was something very rare for Kenwood: a lemon.
It had various problems and developed a very bad on-the-air reputation.
The 950SDX has been reengineered, and is a great radio.

I'm an 850 owner. Can't afford the 950SDX yet. But someday....

You have bought it already? Good Luck!

2638. low power amp capabilities

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-10 00:00:00 UTC
From: o10022@a81.corp.mot.com
Message-ID: <1995Apr10.173238.25440@schbbs.mot.com>
Source record: 218921

Thinking of adding a modest 2m amp to work with my HT, I notice that most of the scanty technical descriptions say something like" 0.2 to 5 watts input" and "2 watts in gives xx watts output". There are no curves which tell me what intermediate input wattages yield what output powers, thus I don't know how much output I'd get when the HT is at its low power setting. And the amps which "accept" higher input powers all seem to require higher input (say, 10 watts) to achieve their max output power

My question is this: if I provide "a little" too much input power, say perhaps 10 watts in (from my HTX-202) to an amp which "accepts" up to 5 watts, will I soon have a damaged amp, or what? I realize that the amps probably (hopefully) have some tolerance of "too much" input, within reason ... but how much?

And, does anyone have comments, good or bad, about the more common moderate power amps ... RF Concepts, KLM/Mirage, Diawa, etc.?

If anyone has practical experience and knowledge in this area, I'd appreciate the benefit of their wisdom.

Tony

Alright, I have a problem. My high school just re-started its ancient radio station (I swear some of the equipment that was in there pre-dated Edison...) anyhow, the problem is that we have an 18-watt transmitter. Yeah, so on a GOOD day, we can broadcast a radius of about three miles. So, is there anyway to boost the transmitting power, or what? How would one go about doing this?? Are we just gonna have to wait and fork out huge amounts of cash for a new transmitter, or can we upgrade the old one. I know these are vague questions, but I don't know *that* much about the intricate workiings of a radio station. I'm just a DJ, but I would like to be heard...

Thanks.

I am searching for OWNER opinions regarding what YOU the OWNER thinks is the BEST Repeater Controller with the best options. For the least amount of $$$. I am piecing together a UHF repeater for SNJ, and could use some advice. Here are some of the options I consider worth while...

1.) AutoPatch, & reverse AutoPatch.
2.) PL encoder/decoder
3.) VOX or COR.
4.) DVR - Digital Voice recorder.
5.) Voice (Female) synth. Min. 425 words.
6.) two or three ports that can link up anyway I want.
7.) CW ID, and timers, and courtesy beeps etc...
8.) Upgradability.
9.) Various Analog ports for measuring voltages. and some means of alerting me.
10.) Various Logical ports (ie...open/closed) and some means of alerting me.
11.) 19" rack mountable case.

12.) As many VOICE alarms, and options as possible.

PS - I have heard some repeaters inform there users of Signal Strength, and Deviation readings...Have you? I would like to know MUCH MORE>>>>>

Please help if you have experience in this area.

: I'm looking for the mods foir the HTX-202 handheld by Icom (Radio Shack). I
: heard it will blow up if I tried to modify it. Can somene advide me here? I'd

Sorry, but there is no HTX-202 by Icom. The Radio Shack HTX-202 is not
modifiable for out-of-band operation.

The HTX-202 is based on the ICOM 02AT with certain design modifications
based on Tandy's specs. These variations include the encode/decode,
additional memories, and a full width LCD display. Contrary to rumor, no
part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design
to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to MAXON, a Korean entity.
MAXON built the HTX-202 for Tandy, under license from Icom. The HTX-202 is
sturdy and well constructed.

Message-ID: <3macoj$kcq@sundog.tiac.net>
Source record: 218934

I just picked up an Icom IC-230 at a local flea market. All I know is that it is a 2M mobile since it came with no docs. I am not able to test the power output. The frequency range seems to be 146-148Mhz with .30MHz steps.

I would like to use the radio for packet at 144.91. Does anyone have any information about this rig? Such as its power output or the way to change the tuning range or step. It seems to have 1 (or 2) memory locations but I haven't the foggiest notion of how to set them.

I am looking for a hardware mod to make my pro-51 receive all the freqs
its capable of. I was told they were available, but have yet been able
to find it. Can anyone help me out??? Or point me in the right
direction??

Scott

Please E-Mail me.

2657. FT-51A Remote Programming Software

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-11 00:00:00 UTC
From: n9cgd@ibm.net
Message-ID: <3mdq69$3nj6@news-s01.ny.us.ibm.net>
Source record: 218846

I recently read a post about a soon-to-be-released package to remotely program the Yaesu FT-51A. My impression was that the package contained a software disk and a cable to interconnect a PC to the 51A, and that the package was to be released at Dayton.

Anyone have any idea about the name of the company, or the booth number at Dayton?

73, Tom N9CGD

Ed Bathgate (ed@fore.com) wrote:
: extended service plan is recommended by me too, I have had one for over a
: year, bought it on sale 1 week after I passed my test. I had the belt clip
: off so it would fit in a coat pocket, and I put the wrong screws back in it
: when I reattached the belt clip. Put on battery, turned it on, smoke! - no
: display. I took the longer screws out - display came up, but no audio or
: rf out. Took back to R.Shack, sent out, fixed in 1 week. FREE! Good as new.

: And I still have 4 more years of FREE repair for my next amazing act of
: stupidness.

: Ed N3SDO

Deffinately get the extended plan. Mine, one of the first few made had many
problems mainly in the finals. It went to the shop seven times in the first
three years and then the guys at the local store said we'll just get you
a new one. Absolutely no more problems with the new one. The money spent
can sometimes be really worthwhile.

Subject: HELP! PWR OUTPUT MODULE TM732

I have a Kenwood TM-732 with no output on VHF. Does anyone know the
procedure to test the rig to be sure it's the PA module and not some
control circuitry? Also, where's the cheapest place to get the module?

Date: 10 Apr 1995 04:38:43 GMT
From: Chris Wysopal <weldp@tiac.net>
Subject: Icom IC-230

I just picked up an Icom IC-230 at a local flea market. All I know is
that it is a 2M mobile since it came with no docs. I am not able to test
the power output. The frequency range seems to be 146-148Mhz with .30MHz
steps.

I would like to use the radio for packet at 144.91. Does anyone have any
information about this rig? Such as its power output or the way to
change the tuning range or step. It seems to have 1 (or 2) memory
locations but I haven't the foggiest notion of how to set them.

>
>73 de N2JCB
>

Yaesu sells a "charging cup" which the battery sets in to charge it. There's
no provision for charging the battery thru the radio. I bought an extra
charging cup for mine - $15 or $20 I think. Way over-priced! But not too
many options if you like the radio. (1 cup and a slow charger comes with
each radio). I fast charge using an after-market universal adapter. The sort
that has 6 different plugs, several hundred ma rating, and switch selected

voltage settings. BE CAREFUL NOT TO LEAVE THE BATTERY IN TOO LONG!

By the way: don't buy extra batteries from Yaesu. Very $$$$. Try after
market suppliers like W&W or Periphex. My W&W battery was $20 less, and
3 times the amp-hours.

daparish@biivax.dp.beckman.com wrote:
: Anyone have any experiences, good bad or indifferent with the ICOM, w21a dual
: band HT? I've been thinking about getting one after also looking at the kenwood
: th79ad, yaesu 51r or a used kenwood th78a. The W21a looks a bit better priced,
: perhaps because of replacement by the new ic-z1a with removable control panel/
: spkr/mic?

<< snip >>

I've been running a 21AT for about two years now. The only complaint I
have is with the stock duckie antenna. Mine went open circuit after a
year. I know of at least one other unit with the same problem. The
stock duck is a poor performer at best, but it does give the radio a very
slick look. You'll probably want a better duck unless you're VERY local
to a repeater. Another thing to watch is the nice big display can be
very easily scratched - a good reason to get a carrying case for the unit.

Other than that, the rig has been up towers, through rain, snow, and hail
storms, and dropped in the mud at least once - coming out ok in all cases -
and no, I don't have a carrying case for it!

BTW, I looked at the new z1a and I'm afraid of the detachable panel.
It's held on by two (very small) plastic clips that will most likely
break off the first time the radio falls or is subjected to extreme shock
of some type. For now I'll gladly stick with my 21AT!

Scott,
Get the 202! Excellent rig! Sturdy and takes a beating (if you give
it one!), comes with extras the others charge for. it's on sale right now
as well. Get the extended service plan too. It's a WELL liked radio and
you can't go wrong buying it. I love mine.

From: ka0mgm@netins.net
Message-ID: <0098EBB6.AA47E768@netins.net>
Source record: 218862

I sent Curtis, the original poster, a piece of e-mail regarding this. I have the schematic from the ts-520 owners manual. I still operate the 520 on a daily basis for the past 13 years. It's a great radio.
On the schematic it calls out the 2 transistors used as "Q1,2:T20A6". Could someone tell me if this is a good transistor number? (T20A6?)
Also the schematic calls out "R1 2.4 5W". Hmmm. 2.4 ohms????
Thanks.
Jim

I have a Yaesu FT 102 that I would like to part with. As far as I know it works fine, I have never really used it, just listened to it. I just bought another rig, so this is taking up space. I have talked with AEA, and Ham Radio Outlet, and they stated that they would sell this rig used for $550 to $600. I am asking merely $400. Interested?? Give me a call at 619-475-1540, or by packet at KC6ZEC @ WB6DGR.#SOCA.CA.USA, or just drop a note here to my mailbox.

If I posted this to the wrong area, my apologies, but I looked in the areas that I have access to, and this seemed the logical choice.

-> I am looking for a new dual band mobile rig which will also do 9600
-> baud packet. In analyzing the available models, I find that the 733
-> is the only one set up for 9600 baud. The 733 also appears to have a
-> good range of other features and claims to have addressed the issue
-> of intermod with AIP. Does anyone have any comments on this rig or
-> have recommendations concerning another? I need to act pretty soon
-> as there is a Kenwood coupon deal that expires in a couple of weeks.
,
I have had a 733A for 2 month now and love the many feature listed and
undocumented commands like cross band repeat. I use cross band repeat at
HAM RADIO 95' here in Atlanta for people not having VHF radio to talk in
on UHF to our security frequency on VHF. Many modifications also and
remote control from an HT is great. Plenty of feature made me get it
instead of the tri-bander. Wish the CTCSS (TSU-8) was installed though.
Many functions and if you like Kenwood its a dead ringer!

>
>In lieu of all of this does someone have the design for the DS-1A
>including transistor part numbers? I'd be willing to roll my own if I
>had the design.

It has been a long time since I've looked at the service manual,
but I recall the most expensive part of the DC/DC converter is built
into the radio already. The man power transformer already has a center-tapped
winding intended for 12V drive; there's also a tickler winding for the
transistor bases.

The external DC/DC module was simply two power transistors on a
heatsink and a bias network. Does anyone have an old TS-520 or
TS-520S service manual around? This will be in it (it came built
into the TS-520, as I recall).

: I remember an article in QST many years ago that described the mod for this
: reciever.

Yep. It was around 1986. I modified one. It required sticking a
variable cap on the board to retune it, and about five other parts
to make the squelch work. (The IC has built in squelch that is unused
in the weatherradio design.) The existing volume control is turned
into squelch and a new pot is installed in the front for volume. It
works though its not super sensitive with the stock antenna. Its
good for monitoring the local (strong) repeater. I think it gets
about 2mhz of 2 meters.

2699. Need Help Solving TS-850S RF Feedback problem.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-12 00:00:00 UTC
From: wave@mindspring.com
Message-ID: <3mhnll$122@henri.mindspring.com>
Source record: 218749

I have a Kenwood TS-850S radio that seems to have an RF Feedback problem. Whenever I have the processor ON, I cannot increase the mic gain higher that 4. I have tried connecting the radio to a dummy load and a 13.8V battery and the problem is still present. The problem is still present without a microphone and with the monitor turned off.

The problem seems to be internal and not related to rf feedback caused by rf on the shield of the coax since it is doing it with a dummyload. Could this be a problem with RF bypassing inside the radio probably in one of the mig gain stages?

IF you have any suggestions or have seen the problem before, I would appreciate any help. This is a recent problem. I've had the radio for one year and never noticed it.

thanks...

2702. Ten Tec RF Counterpoise

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-12 00:00:00 UTC
From: hlester@nemo.as.arizona.edu
Message-ID: <3mhm6c$1840@news.ccit.arizona.edu>
Source record: 218752

Recently I built the Ten Tec RF Counterpoise (kit). The good news is that it works; the bad news is that it was a relative bear to put together. In another sense, it's "not a Heathkit" - but it could have been. Ten-Tec has the opportunity to stand on Heathkit's shoulders, and taken it from there, but one might conclude, from this kit, that they chose to start over.

The classic step-by-step instructions with clear diagrams were somewhat lacking, I found. I had to often refer to the main drawing to help explain the written instructions, and sometimes couldn't tell whether or not I was installing a mechanical part correctly.

There were two particular washer-like components on which I about busted my fingers trying to get them onto the inductor shaft. I finally had to take a hammer to one, and pliers to the other. Two of the six fixed capacitors came with leads that were too short - I had to solder on extra lead lengths.

As frustrating a building experience as this was, I am pleased with the results, having eliminated the RF feedback I was generating on 75m, with just a ten foot wire thrown across the floor. Would I build another Ten-Tec kit? Yes, at least because they work (from what I'd read from a few others), and I still like to build kits.

Source record: 218753

Yesterday I bought the on-sale-for $99.95 2-m amp so I can more successfully use my H-T in the house, the H-T being connected to a roof-top antenna. But, the intermod was killing me! The receive helical filter on this amp DOES WORK, and I'm very satisfied with it. So far I can bring up all the distant repeaters (50 - 90 miles), though I haven't yet determined whether or not my voice can be HEARD through them! The RS manual does NOT say how much power out per watts in - I'm just going to be using the H-T on the 2-watt setting.

For all you microwave experimenters out there, I have for sale a Systron Donner model 1618 synthesizer, 2 - 18 Ghz in 1 Khz steps. The unit has an internal oven oscillator with stability of about in 10e-8/day, and all functions can be controlled from the front panel or via IEEE-488. Output level is from -110 dbm to +10 dbm. Frequency and amplitude are shown on LED readouts. This unit is also capable of AM and FM modulation via external inputs.

The unit is in good working condition, with the exception of normal wear and tear on the exterior. Manual included.

Asking $1500

Help...
I have just acquired a Teletype Perforator/Transmitter, Model TT56/MGC.
The Unit Was made by Baker and Williamson, for the Signal Corps.

I Operate a Antique Radio Museum in Bellingham Washington, and wish to
use the unit for a working display... now the problem:

The units' motor works, and all appears to be in good working condition
except for the fact that the unit seems to be locked into repeating a
single keystroke over and over with each cycle. There is a small relay top
towards the rear which when closed causes this repeating to stop. Also
when I type on the keyboard, none of the keys engage, or type.
Does anyone have any information on this unit? I would like to get a
service manual or copy of one.
Anyone interested in the Museum site can check out what I am doing at:
http://olympic.pacificrim.net/~radio
Any help with this project will be greatly appreciated.
And Thank you!

>Its a great radio with many mod's and non documented commands. Cross
>band repeat and remote control is still a great factor this radio has
>and would buy another one for any purpose.

I own a 733 and am curious to what some of the non documented commands
are. I have the service bulletin regarding remote control using crossband
repeat. I can control the 733 with DTSS tones or use a TH79 in RC mode
and control the 733 with tones also. The RC mode is neat, but it
transmits tones (control tones) which are not needed. I am not aware of
any other non documented commands.

2712. Re: SOMMER 507 vs. 707 ???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-12 00:00:00 UTC
From: Howard Beckerman <hb@hevanet.com>
Message-ID: <3mfdjj$pu1@vista.hevanet.com>
Source record: 218883
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I put a 507 atop a 70 foot tower 2 years ago.

A sturdy unit, the XP-50 series IS probably the best bang for your Sommer bucks. The extra gain you buy with the 70 series may not be worth the cost.

10,15,17 and 20 performance is at least what would be expected for an ant.this size.

The 40 meter dipole has poor directivity; much less effective here than a longwire.

30 meters I'd skip entirely; buy a specific antenna for that if WARC's your thing. Fiddling with the cannister would probably bring it into the band - mine is WAY out at the nominal setting - yet it would still be a dipole with little/no gain. Sommer has admitted to me that 507 won't resonate on 30m at some locales.

In my opinion, 30 and 40m are simply throw-ins.

With regard to responsiveness by Sommer: As we assembled the antenna, we took copious notes. Later, I forwarded a list of suggestions and corrections to the company. These were frustrating oversights and inaccuracies, but nothing major - for the benefit of their future customers.

No response, no thanks. Draw your own conclusions.

In the final analysis, height above ground, proximity to structures, geographical location, etc. may be of more import than whether you buy a 507 or a 707.

Good luck! H

A local buyer/seller of electronics has two of the above for sale. He says that they are designed to make distance measurements of some sort. They also contain voice tranceivers which he thinks are at microwave frequences. They operate off 12 volts and have a small (appx. 10") dish built into the back. I looked them over and wondered if they could be used as ham microwave tranceivers. I have no idea the actual frequency they operate at, power etc. Anyone know anything about these?

Welcome to ham radio. Yes, with a little care and luck, you can talk world wide. Yes, the contact is free, but the equipment you need is not especially cheap (min: $300, max: $10,000+, typical: $1,500). To operate a ham station, you must earn a license by passing a written test on regulations, procedures, and radio theory, and in most cases, reception of morse code. There are five license classes, each granting increasing privileges (frequencies and opearting modes), and each requiring passing a more difficult exam. Ham radio is a non-commercial service; you may not conduct any kind of business or business-related communications on ham radio. If you're just looking for communications service, you're lots better off shopping around for a good deal on international long distance. But if you're interested in a wonderful lifetime hobby, ham radio is lots of fun, very challenging, and very rewarding. For more information on becomming a ham, contact the American Radio Relay League in Newington, CT (203-666-1541). They will send you all sorts of info, and will put you in touch with a radio club in your area that will help you earn your license. Best of luck.

2723. FT-530 Batt. Pack: disabling internal charger?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-12 00:00:00 UTC
From: kreifels@intel.com
Message-ID: <kreifels.797718602@fmwu23>
Source record: 218894

Question regarding FT-530 battery terminals and the internal charger:

I'm using my rig frequently on a 12v supply, but would like to leave the battery attached so I can just pull the 12v plug, put the duckie back on, and go handheld. I don't want the built in charger to charge the nicad pack. The pack has 3 terminals, with the outer ones labeled + & -, and the middle one unlabeled. Is that middle terminal the radio's output for charging the battery? Can I simply block the middle terminal on the battery pack with some insulating material (plastic sheet) to allow the + & - terminals to contact, and isolate the middle contact? I want the radio to run on 12v when plugged in, battery pack when not plugged in, and to not charge the battery.

Anyone know about this? Email or post reply. Thanks and 73.

> >\ |

I don't own the W21AT, but bump into them a great deal. They are the present "radio of choice" amongst the Search & Rescue team I belong to.

The only remarks I've heard is that the heat dissipation is poor at high power settings, and the plastic case is rather delicate compared to Icom's older radios. I own the Yaesu FT51R. It seems to be a little more rugged in design. But it also suffers from rapid over heating at high power outputs. I suspect this is going to be the case for all the "Cutting Edge Technolgy Shrunk Down Real Tiny" radios out there.

I'm not familiar with the other models you mentioned.

In a lot of cases there are people that will buy used stuff and nothing else.
Then there are people who will buy new and nothing else.
Then there are people that will do both. It depends on the type of person you are. If you don't feel comfortable don't do it, or see if a fellow Ham has any suggestions on a particular deal someone is trying to give you on a radio. I mostly buy new and have bought a couple used radios.

>I would like to have some inputs about how does the Kenwood TH-22AT behaves
>in a city (big one).

From what I have heard not too bad considering it is Kenwood.
I have the dual band version myself and don't have any trouble unless I use a super high-gain antenna on it, or unless I go into the dowtown core of a big city.

>Can I use it as a packet radio (not perfect but can I use it)

You can use ANY radio on packet...
The answer here... YES...

>What about intermod.

This is what I referred to about 12 line up about the radio in a big city.
I would recomend the FT-11R if you want a small 2 Meter Radio. The FT-11R has got an excellent exterior, and is VERY VERY well layed out, I cant say anything about good design when it comes to the TH-22AT. The display in the FT-11R is HUGE and the display in the Kenwood TH-22 is tiny. The buttons on the FT-11R are HUGE and on the TH-22 they are of OK size. The FT-11R has a illuminated keypad the TH-22 does not. The Yaesu FT-11R is more user friendly (A first for Yaesu)

>Does it have a too sensitive sql. I have heard someone complaining to make

Not that I know of. There is a possibility you may have that problem with either of the radios but that can be fixed by the user. Yaesu has a keyboard programmable 'fix' for that.

>adjustments but I cant be sure exactly what
>Can it be modified (Just to be sure)

ALL radio's can be modified.
^^^

>Is it prone to have some problems (any)

Kenwood has a fix for a 'memory loss' problem you MAY, I say MAY, have.
I think if you take the battery off without turning the radio off and
then put it back on with the radio in a certain state (on or off?) you may
loose your programmed memories. (I can't remember the way you can loose
your memory but it is something like what I said)

2727. Packet Radio FAQ/Book/Info?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-13 00:00:00 UTC
From: add@philabs.philips.com
Message-ID: <1995Apr13.152000.17699@philabs.philips.com>
Source record: 218760
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

Is there a FAQ or recommended book, or any literature on packet radio?
I am most interested in the protocols used, how it connects to the
Internet, what API toolkits are available, how the nodes are
connected, what wavelengths are used, what antennae are required, and
who are the popular vendors of digital radio equipment. I have heard
of AMTOR (sp?). How does that tie in with things? I guess I am trying
to understand the entire process (every detail) of how a message that
I might send to a friend halfway around the world would get there and
be retrieved by my friend. Once I understand the process, I want to
buy equipment, get a license and start playing with the setup. As is
probably evident from my questions, I am a complete novice at amateur
radio. Any help will be greatly appreciated. Thanks!

I'm looking for Harris Radio IMTS (Mobile Radiotelephone)
RF decks. These look somewhat like a Motorola Micor,
but have round Amphenol connectors for DC and control.

These will usually have "ALPHA" on the Metal ID Tag.

Specifically interested in UHF (Model 2244),
but will consider VHF (Model 2245).

State condition, accessories, etc.

Date: 1995-04-13 00:00:00 UTC
From: ENERGY@cphillips.pdial.interpath.net
Message-ID: <3mi9r1$qd7@redstone.interpath.net>
Source record: 218762

I'm looking to purchase a new video monitor to use next to my
radio gear, and I'm interested your opinions on which brands
cause the least radio interference.

I'm going to get a 15" monitor (SVGA, non-interlaced, for use
with a 486). I have some (non-radio) friends with the CTX, and
it seems like a good monitor, but I haven't had the chance yet to
take a radio over and check them out.

Anybody here use a monitor and computer at the same time they use
their radios (particularly on the shortwave bands)? What brand
of monitor do you use? Does it cause much RFI?

All input is appreciated.

No, you cannot charge a RS stock battery with a BC-35. Although the battery fits in the charger, icom batteries has impressions on the bottom of
the battery case to determine which charge rate is selected, the RS battery
does not. It will depress ALL charge rate pins which depending on
your charger will either shut it down, or drastically overcharge and destroy
your battery. Purchase an Icom battery which is interchangable and you'll
be okay.

Date: 1995-04-13 00:00:00 UTC
From: pve@dg13.cec.BE
Message-ID: <2F8D313E@smtp>
Source record: 218767

Here is my comparison done 6 months ago.
==========

I really love small radios. I have a Mizuho 20m HT (2W from 7 AA batteries - remember the 6m handies AEA was selling a few years back? it's just like those). Thus when the 50S came out I got one of the very first HRO was carrying. I have tuned the memories to my favorite broadcast station frequencies and use VFO-A and VFO-B for ham action. As I operate 20m mobile, VFO-A is on 20m while VFO-B floats about.

Thus I got interested in expanding my collection of mobiles when the Yaesu 900 made its mark on the back cover spread of QST. It looked great. I got interested in buying one. In fact, I started with Yaesu in 1975 (when I bought an FL-50 and an FR-50 - both tube TX and RX rigs) although after an absence of a few years I returned to the fold with a Kenwood 140S - I suppose similarly with many folks, I just like the 'consumer' appeal of Kenwood. Finally I dipped in and ordered the 900 (without the tuner).

The following are personal observations. But anyone would noticed them:

- The TS-50S is small. It's a great package, has very few buttons, and an easy to read display. You can buy a lap top carrier case, put it in, add a flat PS, tuner (I have the MFJ 949D mobile tuner), dipole and cabling and your are all set. It's the future and I presume that in about 6 years, when Kenwood introduces a new mobile rig, the new one would be even smaller that the 50S. However, the lack of buttons means that if you dont like what you are getting, you cant really adjust much. It doesnt even have an SWR indicator (pity 'cause the circuitry is all there to protect the final, so why couldnt they include it in the display?). It doesnt have VOX (big problem for me). The programmable mike is fine too as is the digital power display. I used the 50S extensively during field day, connected to a 10A battery (bought from Ham Contact) connected to a regulator, connected to 82W solar cells. The manual is great to read (see Nov QST, page 13).

- The 900 is bigger, much bigger than the 50S. In fact if it didnt have the remote panel, I wouldnd have bought it. Thus the cost is the basic price $1274 + $50 for the remote kit (compare that with $990 for the 50S). It has an SWR indicator. It has VOX. Voice Processor. a variable power control down to 5W. The manual, although it has many drawings and illustrations, fails to point out things like the reset switch in the back of the front panel and it fails to talk about the panel as a separate entity.

Operating them both, they have the same amount of memories (100), they both have very good noise blankers and they both have good audio(the 50S is more noisy however) that can be tailored to your voice characteristics. However:

- The 900 had the stupid system in that, when you save to memory and read from memory you use both VFOs. Thus if you want to read memory location 10, and you are currently using VFO-A you also update (read:alter) VFO-B. There goes my use for VFO-B as a marker for specific frequencies. This should have been a choice.

- The 900 needs plenty of cabling (power, antenna, front panel) from the back to the front dash. You must turn off the panel speaker to use the jack on the back of the front panel with a manual switch(took me long to find out about this jack - it's not labeled on the back of the front panel). Why cant the computer of the front panel tell the main unit, via the serial intereface, that there is a speaker connected to the front panel therefore turn off the main speaker?

- The 900 uses an RJ-45 connector for the microphone. This is an 8 pin connector normally used for twisted pair local area networks (these are called 10Base-T). Without a special crimping tool you cant use one. But they are dirt cheap (5c in qualtities). For me with all the tools available here, the 45 is great. But for 99.9% of the hams it would be a pain to work with.

- The 900 VOX switch is on the main panel. Thus to operate VOX, you must stop the car, get out, go to the back, turn VOX on by pressing the VOX switch, close the doors carefully not to make too much noise. and repeat such operation to turn it off. This is pathetic. Why couldnt Yaesu control the VOX with the computer through the remotable front panel? The processor switch (which is in the front panel) should be changed with the VOX switch.

- The 900 has SUPERIOR AUDIO. As soon as I turn it on, the 900 exhibits beautiful audio with very good noise characteristics. In fact I thought there was a problem with the antenna, but it's just that noise is very low.

- The 900 has an SWR meter and ALC indicator. And a great to read display. However, in a difference from the past, pressing the GEN button turns on the GEN light on the LCD which in the days of the 747 would mean that GENERAL coverage during transmit is enabled - not the same meaning here.

- Tuning facilities, the 50S beats the 900 easily. You can prpogram the tuning steps for either SSB or AM/FM for the up/down buttons in various steps (50Hz, 100Hz, 1KHz, 5KHz in SSB) or (1KHz, 5KHz, 10KHz in AM/FM). The 900 has no such options. You use the UP/DOWN switches in combination with the FASTand GEN buttons to go up and down (in SSB its 2.5KHz steps - not much good in trying to listen for activity - I prefer the %)s 1KHz step). I suppose its just different.

- Using the 900 for the first time, I am not going to give ("I worked a station in Ulan Butor with a coat hanger and 100mw on AM voice just as soon as I turned it on") replies because they mean nothing. Suffice to say that the tramsmitter works great; great radios mean great receivers. Most tramsmitter as basically the same.

I plan to use the 900 in the car every day, as I have done with the 50S. I am daily on 14.280-14.290 at either 0620Z and 1600Z for about 10 minutes on the ride to and from work. If you want to try and meet me there you would be welcome. Then I would see how well the tranmitter works on a DX path.

I must admit that if the TS50S had the receiver of the 900 it would be the best radio ever. As it is, they are both good radios. I am glad I have them both (so does my credit card company).

Peter,

I am forwarding to you a message I received from Peter Casier, ON6TT, who just got back from a consulting job that allowed him to play radio on the side as 9Q5TT in Zaire. I asked him about it, because he was the first I had heard of that actually ran the rig through the grinder, so to speak. He made about 9000 QSOs in approximately 2 months with it. He is impressed with it, and so am I. I'm just waiting for my tax refund so I can actually buy it. ;^)

73 and enjoy.

Paul Walker, N9WHG

Source record: 218769

On page 4 of May QST: (yes, I'm usually the last one to get
my issue; this is a miracle)

Alinco DX-70T!!!

HF (100 watts) plus 6 meters (10 watts)
Allmode, general coverage, 2 VFOs, 100 mems, full QSK, 500 Hz
CW filter, RIT/XIT, 38 CTCSS tones, noise blanker, RF amp/att,
subdial for bands, mems, and tuning, large tuning knob.

Ready for this?

2.25" high x 7" wide x 9" deep and weighs 6.2 lbs.

I almost screamed when I saw it (how did they keep it a secret?)

P.S. NO PRICES YET because it's not FCC-approved yet.

AND:

Icom just introduced the IC-775/775DSP this month, p.2.

Try turning off your TX Saver. It could be you're in a borderline area
for said repeater. The TX Saver uses the signal coming back from the
repeater *WHILE YOU'RE TRANSMITTING* to automagically lower your output
power if you're receiving the repeater full-scale. It also reduces power
when you're not speaking into the mike when the PPT is pushed. Too bad
you took the radio back as I suspect that that's the "problem".

I never have found a use for Yaesu's TX Saver on my -530. Many repeaters
in this area (No. VA) give me full scale but I can barely hit them worth a
hoot with the HT on L1 power. So, full scale from the repeater doesn't
mean I can reduce power while xmitting and thusly, that TX Saver doesn't
do me much good. Everyone use to tell me that I was dropping out all the
time so I turned it off once I figured out what was happening.

Yes there is, but I don't know it. I had my O2AT modified at a hamfest, and it now transmits and receives from about 130 mHz to about 170 mHz. I know it's only a coule of diodes, but which ones????

Brian,

I think the rig is a piece of junk made in Korea. Why didn't you buy a
quality rig from a full service ham dealer at or below what you paid
for that RS junk?

Hmmm, You could just use the 12v supply without having the battery on it. Then when you want to go mobile, slide the battery on and disconnect the power supply.

Also, I believe you asked about the 3 terminals, I really have no idea on those, you may want to contact yaesu about that. But in all likelihood just use the above method. Simply use the radio (w/ the battery cover on or off, I don't care, but it's your radio of course) without the battery on and use the 12v supply, then when you want it, just unplug the supply, slide on the battery, connect the rubber duckie, and go.

Yeah, I know it's off-topic, but I'm looking for info on specific brands of (single-line telephone) modems that offer voice mail as well as data and fax. I'm looking for something to update my 2400-baud "Complete Communicator". I bought a 14.4 KB "Sound Expression" board made by Boca Research (the successor company to the outfit that produced the Complete Communicator). The sound quality was simply AWFUL, even after Boca shipped me a "software fix" that was supposed to resolve the problem.

I see that the latest (April 25) issue of PC Magazine has a review on P. 54 of Spectrum Signal Processing's "OfficeF/X" board that includes voice mail capability, but once again there's reference to "muddy" sound quality. Does anyone have any experience with that or any other PC board that can take an incoming call, answer it as an answering machine if it's a voice, as a fax if it hears the fax tone, and as a data modem if it detects data?

When in the car, I do exactly what you propose. But for using the HT on my motorcycle, I need to keep it in the vinyl case for protection from bugs and weather. It's more of a pain to wriggle it out of the case to put the battery on and off. That's why I'm looking for a solution that defeats the charger, but leaves the battery pack in place to run the rig in the absence of an external supply.

Anybody else out there know how to temporarily disable the charger, or what the effect of disabling the 3rd battery terminal would be?

2750. Station For Sale - sellin

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-13 00:00:00 UTC
From: jay.serafin@n9csa.com
Message-ID: <9504131817091505@n9csa.com>
Source record: 218783

I have the following ham station equipment for sale. Due to a back injury I suffered last year, I am finding it increasingly more difficult to sit an "play" anymore.

Kenwood TS-140S all-mode HF with AM/FM. Solid state. 100W output. 10-160 meters, all WARC bands. General coverage receive from 50kHz to 35MHz. Dual adjustable noise blankers. Speech processor built in. Full or semi QSK. Dual VFOs. Great for working splits, contests, 10 FM, etc. VOX, fast/slow AGC. 20 memories, including split tx/rx memories. RIT, IF shift Excellent working condition. Includes a 25A continuous power supply with overload/short circuit protection. Great mobile rig, if you're into that mode. Includes Kenwood MC-80 desk microphone (which also controls freq. up/down). This unit has seen less than 20 transmit hours. Have enjoyed SWL listening for more than that time, or course. No CW key included.

Daiwa CNA-2002 2.5kW PEP automatic antenna tuner, covers 10-80 meters, including WARC bands. Switchable for 2 antennas, and also has 100W dummy load built in. Cross-needle metering. Dual "fine-tuning" knobs for when you switch frequencies from where you're tuned up at. Can be "bypassed" using the front panel factory button. Works well, tunes within 5-30 seconds, with as little as 5W drive. 20/200/2k switchable metering. Works quite well, tunes with no problem every time. Fast and slow tuner motor control.

I am also including 2 vertical antennas. One is a 5BTV 10-80 meters, the other is a Cushcraft vertical 10-80M that includes the all the WARC bands. Both tuned for phone portion of bands. Stainless steel hardware. Both antennas have NOT had more than 110 watts thru them.

Will include approx. 75' of Belden 9913 coax for each antenna.

I will not separate these items, as I would like to be able to "show" it all to a single buyer. Prefer to sell to a local ham (within reasonable driving range of Chicago), due to shipping restrictions on boxing all the items up, breaking down antennas, etc. All items are hooked up at the present time and are fully operational.

I do have the manuals for radio and antenna tuner. I do NOT have the vertical manuals available, as I lent them out, and never got them back. But, they are available from the manufacturer for approximately $10 each.

Asking $800 for complete station. Please, no trades for other equipment.

Contact me either thru my Internet address of: jay.serafin@n9csa.com or telephone me at 312-776-8448. Due to costs, I will not be able to

return long-distance phone calls concerning questions about this station setup.

Thank you for taking the time to read this post.

Jay Serafin, N9CSA.

2751. C568A First Impressions...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-13 00:00:00 UTC
From: scam@siu.edu
Message-ID: <v01520b00abb3035c10cd@[131.230.253.10]>
Source record: 218784

Note: The opinions expressed here are my own,
not of Stanard Amateur Radio Products, Inc. or
Marantz Japan, Inc.

The Standard C568A is the newest of the company's dual band HT
series. The unit is a compact (measuring 134.5H x 47W x 34Dmm), high
performance dual band HT capable of full operation on the 2m and 70cm
amateur bands with a 1.2ghz suband. Dual in-band receive/transmit (VxV,
UxU, VxU and UxV, Vx1.2, Ux1.2) is possible on 2m and 70cm, with the left
side being the VHF main band and the right side being the UHF main band,
with main band performance in the sub-band. 1.2 gigahertz operation is
restricted to the right side. Output power is 2.6 watts (H), 2.5 watts (M),
350mW (L), 35mW (EL) on 2m and 440mhz at 7.2 volt with approx. 35mW out on
1.2ghz. The transmitter will produce 5 watts output at 12V DC in, via
either the optional CNB172 battery or 12V input at the DC in terminal. No
adapter is required for 12V operation.
The C568A receives from 110-199mhz, 310-399mhz, 400-499mhz,
800-975mhz (cell blocked), and 1.2-1.3ghz out of the box, no modification
needed. A combination of ceramic and bandpass filtering is used to provide
for wide-band receive and decent intermod rejection. While the intermod
rejection isn't as good as a Motorola Saber, with 9 high/low pass and 5
bandpass filters, it's MUCH better than anything Icom, Yaesu, Kenwood or
Alinco currently offer. Multiple vcos for each band provide wide RX
coverage, while insuring good sensitivity during sub-band operation.
Sensitivity is rated at better than .16uV for 12dB SINAD, VHF/UHF amateur
main band, and less than .18uV UHF amateur suband. (440 operation on the
VHF side.) 1.2 ghz sensitivity is rated at less than .28uV for 12dB SINAD.
The C568A comes with the CMU160 memory unit installed, which
provides for 40 memory channels, 20 per side, but any VHF/UHF combination
of memories can be stored, because sub-band (UHF/VHF) operation is possible
on either the left or right side. There are sperate CALL channels for each
band. All memories are capable of storing odd offsets, as well as CTCSS
tone, DTMF squelch and paging codes and CTCSS squelch status. The are seven
15 digit DTMF memories for storing phone numbers or repeater control codes.
(The QST ad states that there are 4 DTMF memories, but there are actually
7.) The optional CMU161 offers 200 channel operation. Memory scan is very
speedy, but the number of channels per second is difficult to determine.
It's not listed in the manual, but my best estimate is over 20
channels/second. During battery save operating scan speed slows depending
on the save duration.
Current drain is listed as follows:

Transmit:
13.8V: 5 watts: 1.1A VHF
1.3A UHF

2.5 watts: 850mA VHF
950mA UHF
7.2V: 2.6 watts: 880mA VHF
980mA UHF
2.5 watts: 850mA VHF
950mA UHF
350mW: 480mA VHF/UHF
50mW: 100mA VHF/UHF
35mW: 120mA 1.2ghz

Receive:
Sqelched, dual band: 68mA
Suelched, mono band: 37mA VHF
48mA UHF
52mA 1.2ghz
Battery Save, dual band: 28mA
Battery save, mono band: 17mA VHF
18mA UHF
20mA 1.2ghz

Note that these are nominal specifications, NOT best case scenario figures. The actual current drain is often significantly LOWER than these numbers. This is why Standards get the better battery life.
The C568A is constructed of cycalac (what Motorola GPs are made of, although not nearly as much of it, the walls are thinner.) and aluminum alloy. The alloy back doubles as a heat sink, of course, for high power operation and to dissipate heat generated by the voltage regulator during 13.8V operation. It's very solidly built and feels rugged. The keypad is rubberized and has a positive feel. The keys are well spaced and fairly large for an HT of this size. The keypad is NOT backlit, but the LCD is. This is intentional, as transluscent keypads tend to desintegrate with time. (Ask any Alinco owner.) The keys have a protective coating, which will prevent the numbers from rubbing off.
I haven't had a chance to spec out the receiver, but will post my findings as they happen. Of particular interest is a sensitivity curve for the out of band receive. When posted, these will be usable sensitivity figures, not the ridiculous squelch opens figures normally posted. I'll also post the out of band TX specs for those of you curious about the C568As potential as "test equipment." Stay tuned.

2754. INFO: Yaesu FT51R problem...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-13 00:00:00 UTC
From: KJPK74E@prodigy.com
Message-ID: <3micjc$1k46@usenetp1.news.prodigy.com>
Source record: 218787

I rencently purchased an FT51R about a month and a half ago. After about two weeks, I discovered a problem with it on the 440 side. At a certain frequency and above (exactly where unknown) the radio would transmit sporatically. When I discovered this problem, I was receiving on 444.975 and transmitting on 449.975. On the EL and L1 power settings the radio transmitted fine. But, on L2, L3, and HIGH power settings, the radio would pulse transmit sorta like when your battery is just starting to totally lose all power. The person that I was talking to could understand about the first word of what I said, then it would start pulsing. At this point none of my audio was making it over the air.

The reason that I posted this info is to see if anyone else has experienced this trouble. I took the radio back to where I purchased it RT Systems out of Huntsville AL (bought at a hamfest, and swapped at another fest). They were very nice and exchanged the unit without any hassle.

I have not experienced this with the new unit, but it is only 4 days old. If several people experience this problem, there may be a design flaw. If this works out ot be the case, we need to band together and let Yaesu know of the problem. Yaesu is DAMN good at diagnosing and ADMITTING to design flaws when they happen, and will correct the problems for free. They are an extremely reputable manufacturer and will solve ALL problems. Don't let this message scare you away from Yaesu. This might have been an isolated incident, and even if it is not Yaesu WILL correct it.

Again if you have experienced this problem, Please E-mail me.

Bill kjpk74e@prodigy.com

2755. Subject: kenwood tm241a display problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-13 00:00:00 UTC
From: pve@dg13.cec.BE
Message-ID: <2F8CD146@smtp>
Source record: 218788

The 241A has a problem in that if the covers are slightly bent into it, the display will go weird, light up everything etc.

Take the covers out, flex otowards the oustide a little and screw them back in.

It will work fine then. I bought it from HRO 3 years ago and it still works fine in the car.

The 241A is a fine radio (although the DTMF option shouldnt be an option).

Hello,

If you are not in driving distance from Central MA, this post
may not apply to you. Otherwise, please read.

Our club has lost our 6m transmitter site for our 6m split-site
repeater. We are having trouble finding a new site for this unit and
have decided to try to find a set of cavities for 6m to run the unit
from a single site.

If you have or know of a set of cavities - let me know. I believe we
can use most VHF low (46 MHz) commercial cavities with modification;
so if you know of a set becoming available, they will work too!

Of course, since 6m cavities are rather large, they must be within
driving distance from central MA so that we can pick them up.
Otherwise, shipping costs will be prohibitively expensive. But I
would still appreciate knowing if a set is available at a fair
distance - we may get desperate. :->

You can reply to me directly at chilton@emc.com (preferred) or call me
at home at (508) 481-0038. I am usually not home, so if you do call,
please leave a message on the machine and I'll call back ASAP.

Thanks,
(et 73)

Hi all,
Recently i have been seeing much posted on the HTX-202 HT. ANd, i have seen many price quotes for it. i am interested in purchasing one, but i cannot remember which news group (thus the cross-post, sorry) i saw a comment that some mail-order company was selling it for less than Radio Shack. Can any one help me? Does any one want to part with theirs for less than i can get it new?
Thanks very much!

- peter =)

Just out of curiousity, what ever happened to the supposed lawsuit
against the "The Net" people by the "Netrom" people over copyright
infringement? I remember a lot of talk about this several years ago, then
it just disappeared... 73 Barry

> low?
>

Yes, the tabs on the bottom are for connecting to the fast charger and
connected to the NiCd cells via diodes to prevent damage if shorted
together. I think the diodes are Ge to minimise the voltage drop. This
would explane why you measure some voltage rather than none, Ge diodes
do have a much higher revers leakage than Si. If you try measuring
with an analogue (20k/V) meter you would get a much lower reading.

From: sgarvin@encore.com
Message-ID: <D716nn.BEo@encore.com>
Source record: 218807

I posted this article last week but it seems to have disappeared. I was looking for the modification to the ICOM IC-W2A that while in DUAL BAND MODE you decide to transmit on either VHF or UHF it would quiet the other band that was recieving. There is such a mod. just can't find it in oak.oakland.edu.

Hey, Howard - thanks for posting this, as I also just bought
one and haven't even had a chance to hook it up yet.

As for your power output, Rat Shack *does* have a nifty
little VHF power/SWR meter (or at least *did* the last time I knew)
that might help you answer that question. I have used one to tweak up
my 2-meter antennas with quite satisifactory results.

What I don't recall is how much max. power you can hit that meter
with......

I also snagged the DSP filter which had a pretty good markdown -
planning on using it on 10 meters and also for my SWL'ing....

>Yes there is, but I don't know it. I had my O2AT modified at a
>hamfest, and it now transmits and receives from about 130 mHz to about
>170 mHz. I know it's only a coule of diodes, but which ones????

'Fraid I can't answer that one, although I *know* that lurking
somewhere in my apartment is a whole poopsheet on this mod.

A don't know how well yours went, William, but on mine the
sensitivity of the receiver that far up at 162.whatever isn't
real stunning. I can get the NWS stations but they are usually noisy
unless I am fairly close. Quite frankly, my little Maxxon weather radio
does almost as well WITHOUT its antenna !! Put an antenna on it and it
beats 02AT mod hands down, and for cheap. I usually have to run the
02AT with the squelch wide open or close to it to really reliably
get the NWS stations from inside my apartment or any other building,
and also hold the radio up near the ceiling.

To the original poster, my suggestion would be that if this
is the only reason you want to do the mod to your 02AT - DON'T. Just
go out and get a decent weather radio and forget having your 02AT hacked.
And for sure as hell don't get the hack done unless the radio is out of
warranty, which it probably is at this point in time.....they've quit
making the 02AT's now, haven't they? Too bad - not a fancy rig but mine has
been super reliable.

I seek information on commercial 30 meter yagis. I am looking for a good 2-element yagi to stack above my Mosely PRO-67B. Force advertises a model but I see no other manufacturer offering anything. I have considered modifying a Cushcraft 2-element 40 meter yagi. Suggestions?

2779. Re: Teletype Help...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-14 00:00:00 UTC
From: Dave AB5S/7 <72227.1640@CompuServe.COM>
Message-ID: <3mmeue$fh9$1@mhadf.production.compuserve.com>
Source record: 218812

The unit is doing what is called "running open,"
which means you are not supplying line current to
close that relay you're looking at.

The teletype gear requires an external line voltage
supply to pass through the relay, called a "selector"
relay, through the keyboard and back out to the wire
line that ran to the other station at the end of the line.
Your keyboard will have a set of contacts controlled by
a mechanicall linkage that opens and closes them in
a certain pattern for each key. You need to wire
these contacts in series with the "selector"
relay coil and feed a voltage to them to make the
unit type. Now, old Teletype corp units used
70-110 VDC for this line current. I have no
idea what B&W uses. You might want to start
at 20 VDC and work your way up until
that relay closes to find out.

To throw more fat on the fire, you might have a
"line repeator" or "polar" relay in the loop
with the selector relay, which complicates things.
I hope this will get you started.

In the worst case, temporarily clip-back the wires
to your relay and keyboard contacts (to take that
complicated stuff out of the way), pass enough current
through the series loop to close the relay reliably,
then type away. It sould work until you can find
a manual on the unit.

Having figured out a model 19 in my youth, I sure
feel for ya! Good luck and enjoy all that banging
and grinding!

Yeah, that's a good price for one and the filter does work. Mine
typically puts out 30 watts with 5w input. It does about 40 watts
with 13.8v vs. 12v.

Yeah, they used to have one. It allowed 60w max input. They were
discontinued last year.

Don't forget that the HTX-202 is on sale for $189.

> or does it always have to run off the battery?
>

W&W makes a battery eliminator that can be used with the 51R. It
fits in place of the battery and has a cord with a 12v cigarette
lighter plug on the end. The eliminator supplies 8 to 8.4 volts
to the HT. At that voltage the 51R produces 4W rather than the
full 5W. According to W&W the lower voltage is used so that
the 51R doesn't overheat.

2784. Mods for ICOM IC-2GXAT?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-14 00:00:00 UTC
From: amn1@cornell.edu
Message-ID: <amn1-1404951625360001@132.236.42.179>
Source record: 218817

I purchased a IC-2gxat, mainly because I liked the "feel" of it, and I needed 7 watts on a battery pack. My main question is are there any mods available for this rig? I'm mainly interested in "out of band receiving". This isn't too important since I'm in the market for a mobile unit that has out of band receiving capablities. This is so I don't have to install a scanner in my car to listen to the fire Dept's (of which I'm a member) hi-band freq's.

I am going from memory here but I think it's around 30 watts in the car
with 2 watts input from my DJ560. One watt input out of my HTX-202
gives about 25 watts output.

The AA battery holder for the FT530, FT416 & FT816 doesn't have the third charging terminal. You can use it with NiCads but it is not recommended by Yaesu (Caution: Be sure the insulating cases of the NiCads don't rub through and short-out due to vibration & friction within the pack).

Too bad nobody has made an adapter section to let you use older-model batteries with the newer units... I guess that would defeat the strategy of planned obsolescence.

In article <v01520b00abb3035c10cd@[131.230.253.10]>,
Scott Manthe <scam@siu.edu> posted the first half of an interesting
Standard C568A dual band HT review. First, thanks for sharing
your findings. I note the passage:

>.... Of particular interest is a sensitivity curve for the out
>of band receive. When posted, these will be usable sensitivity
>figures, not the ridiculous squelch opens figures normally posted...

Why is squelch sensitivity a ridiculous measurement?
Both metrics have value.

By squelch sensitivity, I assume you are speaking of how strong
a signal must be to open the squelch.

Squelch sensitivity is often important, for example:

(1) Waiting for a call while the receiver is squelched.
(2) Scanning memories or searching (sweeping),
during which time the squelch is closed.

Squelch circuits with a lot of hysteresis force the operator to
to keep the squelch "tight," missing weaker signals which a
sensitive receiver would have little trouble hearing when the
squelch is open.

Note: I have included the scanner newsgroups in this followup because
the extended receive coverage of the C568A is of interest to
those readers, many of whom are hams.

2794. Need help with Motorolla Radius

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-14 00:00:00 UTC
From: seguine@sirius.com
Message-ID: <seguine-1404951713530001@slip120.sirius.com>
Source record: 218827
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner

I have a Motorolla Radius M216, It has an acessory connector on the back, like 20-pins or so. Does anyone have the pinouts for this? I would like to hookup a voice inversion box to the unit and I need to get audio out and into the radio. I'm also interested in the pinouts for the mic connection, I understand that they interface to a computer through that port.

thanks

Does anyone know anything about this radio?

I saw it in one (1) mail order catalog. There was a small write up that
did not contain a whole lot of info (no dimensions, receive coverage, etc...).
I called the company, but they had no additional info. I then called
Icom and requested info on their complete product line. I received a lot
of info, however there was none for this radio.

Any help would be appreiciated as I might like to buy this radio.

Thanks, Mike KC7JGC

2797. Charging RS HTX-batteries

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-14 00:00:00 UTC

Source record: 218830

Subject: Charging RS HTX-batteries with BC-35???

>>HTx-202/404 batteries have the same form factor as Icom batteries.

Makes you think, doesn't it! <grin>

>>The Icom BC-35 charges the BP-x series batteries.
>>Can it charge the HTX-series batteries? -- 72 and 73!

NO!

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to MAXON, a Korean entity. MAXON built the HTX-202 for Tandy, under license from Icom. The HTX-202 is sturdy and well constructed.

MISCELLANEOUS NOTES: Some HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

I also have one that I use with my homebrew switchbox so that I can switch from packet to voice. MFJ didn't impress me. Anyway the radio works as I expect for the functions it has. Too bad Duffy can't find the stirrups to get off his high horse and try to realize that not all radios are created equal in his eyes. Each radio suits different people. I own Kenwood, Icom and the HTX212. I have no problem with any of them or with any of their functions I bought for their reasons. I saw the matrix RS has at the store that compares the HTX212 with alinco, kenwood, yaesu, icom and standard. All are similar in functions, price and performance. Also who dictates what a "full service" ham dealer is. Hamtronics in PA is supposed to be a "full Service" ham dealer, but has ripped off many a customer in sales and service and has had their share of flaming here too. So I can't go by that philosophy. Korea....So what, I could care less if it was made in Poland! It had the specs and style like any other 2m mobile rig out there. Good thing Duffy doesn't write articles for Consumer Reports...

Duffy,
I don't know what your problem with RS stuff is, but on this
one you're wrong. Wake up and get a life. The HTX-212 has
all the features of the rigs from the "ham" manufacturers,
and also has a much better receiver. The price is right, too -
better than most available from other sources. Not everyone
lives next to AES, HRO, Texas Towers, etc., etc., etc....
Where it's made (or who made it) is immaterial if it's a
good piece of gear, which it is. If you don't like Radio
Shack, that's fine - you can exercise your consumer right to
not purchase from them, but when you're wrong (as in this case),
go off and sulk somewhere else.

RS still has the VHF meter, it's just not stocked in the stores anymore.
Have the store guys look in their "express order" book - they can
enter the info into their computer, and the warehouse will mail one
directly to you. It's a fairly decent little SWR/wattmeter.

Thanx for the info, I have found a few helpful people out there. I still dont have a radio tho, someone offered me one for $300 or $350, but I have no way of knowing what to buy or how much the equipment is worth. I hope the fellow wasnt insulted, but that seems too much. If I could buy a receiver to start with, it might bring the price into line for me...I also still need a license (I guess), and if I get a erceiver first, it should give me an idea if I like it or not.
Thanx again for all the info.

2805. WISP Help Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-15 00:00:00 UTC
From: Gerald Schmitt <ggs@aerie.lanl.gov>
Message-ID: <3mq9c6$h6e@newshost.lanl.gov>
Source record: 218703
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

OK folks I give up. I need some help. I am running WISP with
a KPC-9612 trying to access the pacsats. Rig is FT-736
with the GB3RUH mod for 9600 baud. Antennas and rig are
controlled by a Kansas City Tracker card. I have optimized
the TNC for transmit with a AEA DM-1 and it is right on 3kHz
I also optimized the receive per Kantronics instructions.
The antennas point and the rig get tuned. The 9600 baud signal
breaks right through the squelch, the port 2 receive light comes
on solid, the connect light flickers. On the bottom of the status
display for msre the "T:" display racks up bytes at a great rate
but at the end of the pass I have nothing but KISS files for my efforts.
I would guess I have something set wrong but I can't figure it
out. For the first effort I am just trying to get a directory
so no joy. Any help will be greatly appreciated.
By way of my contribution I played with the mike drive on the 736
with the deviation meter in line and found no change in deviation.

2806. Re: Charging RS HTX-batteries with BC-35???

Source record: 218704

John LaMartina (jlamar@yrkpa.kias.com) wrote:
: Scott Richard Rosenfeld (ham@wam.umd.edu) wrote:
: : HTx-202/404 batteries have the same form factor as Icom BP-x batteries.
: : The Icom BC-35 charges the BP-x series batteries.
: : Can it charge the HTX-series batteries?
: No, you cannot charge a RS stock battery with a BC-35. Although the
: battery fits in the charger, icom batteries has impressions on the bottom
: of the battery case to determine which charge rate is selected, the RS
: battery does not.

Icom rapid-charge packs also have a thermostat to sense temperature rise of cells at full-charge; it opens and interrupts the charging current, the charger senses the loss of current and latches off until the pack is lifted. The BC-35 depends on the thermostat in the pack to stop the charging when the pack is fully charged, but the RS pack has no such device to perform this function.

So merely cutting the "right" notches in the bottom of a RS pack without adding the little Klixon thermostat gizmo inside the pack and in series with one of the charging studs would make a potentially hazardous condition. (Can you say "burning like a house afire?")

I know that the BC-30/35 chargers can provide a couple of different "standard charge" rates as well as the rapid-charge rate, but I don't recommend them. It's still easy to overcharge the cells, even if it takes longer.

: Purchase an Icom battery which is interchangable and you'll
: be okay.

The safest and easiest solution.

Hello,

I have one of the newer versions of the Kenwood
TH-78A dualbander HT. It is the model with the two
green looped wires inside. The serial number of
my radio is 60200185.

Does anyone happen to know modification information
for this radio? I have heard that it can receive
commercial FM, as well as onto the 300 and 800 Mhz
bands. The only information I can find about
modifying the TH-78A is for the versions without
the green looped wires.

Your help is greatly appreciated!

Dear Seth,

I just spoke to Mike (kc4yhz) on a recent trip. He does these mods. He gave me his phone number but i am not sure he wants it on the net. I will contact him and ask him about this.

TR>Alinco DR-MO6 rig. It seems there aren't many 6 meter rigs out
TR>there. Opinions on other 6 meter rigs are welcome as well. Thanks in
TR>advance.

Thomas, I would settle for less then a all mode six meter unit like the
new Kenwood TS-60. If you are looking for something more on a base
level look into the HF units w/six meters built in. For my money I
would go with the TS-60 which can be used as either a base or mobile rig
with 90 watts.

From: scam@siu.edu (Scott Manthe)
Subject: C568A First Impressions...

Note: The opinions expressed here are my own,
not of Stanard Amateur Radio Products, Inc. or
Marantz Japan, Inc.

The Standard C568A is the newest of the company's dual band HT
series. The unit is a compact (measuring 134.5H x 47W x 34Dmm), high
performance dual band HT capable of full operation on the 2m and 70cm
amateur bands with a 1.2ghz suband. Dual in-band receive/transmit (VxV,
UxU, VxU and UxV, Vx1.2, Ux1.2) is possible on 2m and 70cm, with the left
side being the VHF main band and the right side being the UHF main band,
with main band performance in the sub-band. 1.2 gigahertz operation is
restricted to the right side. Output power is 2.6 watts (H), 2.5 watts (M),
350mW (L), 35mW (EL) on 2m and 440mhz at 7.2 volt with approx. 35mW out on
1.2ghz. The transmitter will produce 5 watts output at 12V DC in, via
either the optional CNB172 battery or 12V input at the DC in terminal. No
adapter is required for 12V operation.
The C568A receives from 110-199mhz, 310-399mhz, 400-499mhz,
800-975mhz (cell blocked), and 1.2-1.3ghz out of the box, no modification
needed. A combination of ceramic and bandpass filtering is used to provide
for wide-band receive and decent intermod rejection. While the intermod
rejection isn't as good as a Motorola Saber, with 9 high/low pass and 5
bandpass filters, it's MUCH better than anything Icom, Yaesu, Kenwood or
Alinco currently offer. Multiple vcos for each band provide wide RX

coverage, while insuring good sensitivity during sub-band operation. Sensitivity is rated at better than .16uV for 12dB SINAD, VHF/UHF amateur main band, and less than .18uV UHF amateur suband. (440 operation on the VHF side.) 1.2 ghz sensitivity is rated at less than .28uV for 12dB SINAD. The C568A comes with the CMU160 memory unit installed, which provides for 40 memory channels, 20 per side, but any VHF/UHF combination of memories can be stored, because sub-band (UHF/VHF) operation is possible on either the left or right side. There are sperate CALL channels for each band. All memories are capable of storing odd offsets, as well as CTCSS tone, DTMF squelch and paging codes and CTCSS squelch status. The are seven 15 digit DTMF memories for storing phone numbers or repeater control codes. (The QST ad states that there are 4 DTMF memories, but there are actually 7.) The optional CMU161 offers 200 channel operation. Memory scan is very speedy, but the number of channels per second is difficult to determine. It's not listed in the manual, but my best estimate is over 20 channels/second. During battery save operating scan speed slows depending on the save duration.
Current drain is listed as follows:

Transmit:
13.8V: 5 watts: 1.1A VHF
1.3A UHF
2.5 watts: 850mA VHF
950mA UHF
7.2V: 2.6 watts: 880mA VHF
980mA UHF
2.5 watts: 850mA VHF
950mA UHF
350mW: 480mA VHF/UHF
50mW: 100mA VHF/UHF
35mW: 120mA 1.2ghz

Receive:
Sqelched, dual band: 68mA
Suelched, mono band: 37mA VHF
48mA UHF
52mA 1.2ghz
Battery Save, dual band: 28mA
Battery save, mono band: 17mA VHF
18mA UHF
20mA 1.2ghz

Note that these are nominal specifications, NOT best case scenario figures. The actual current drain is often significantly LOWER than these numbers. This is why Standards get the better battery life.
The C568A is constructed of cycalac (what Motorola GPs are made of, although not nearly as much of it, the walls are thinner.) and aluminum alloy. The alloy back doubles as a heat sink, of course, for high power operation and to dissipate heat generated by the voltage regulator during 13.8V operation. It's very solidly built and feels rugged. The keypad is rubberized and has a positive feel. The keys are well spaced and fairly

large for an HT of this size. The keypad is NOT backlit, but the LCD is. This is intentional, as transluscent keypads tend to desintegrate with time. (Ask any Alinco owner.) The keys have a protective coating, which will prevent the numbers from rubbing off.
I haven't had a chance to spec out the receiver, but will post my findings as they happen. Of particular interest is a sensitivity curve for the out of band receive. When posted, these will be usable sensitivity figures, not the ridiculous squelch opens figures normally posted. I'll also post the out of band TX specs for those of you curious about the C568As potential as "test equipment." Stay tuned.

Subject: Re: Looking for Mods for HTX-202 or will it blow up?

: I'm looking for the mods foir the HTX-202 handheld by Icom (Radio Shack). I
: heard it will blow up if I tried to modify it. Can somene advide me here? I'd

Sorry, but there is no HTX-202 by Icom. The Radio Shack HTX-202 is not modifiable for out-of-band operation.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to MAXON, a Korean entity. MAXON built the HTX-202 for Tandy, under license from Icom. The HTX-202 is sturdy and well constructed.

Subject: RS HTX 202 -- Good Price

Subject: RS HTX 202 -- Good Price or.....

>>Is this a case of "you get what you pay for"?
>>I noticed RS has the 202 on sale for 189.00, or from U.S. Radio mail
>>order for 169.00.

No - the HTX-202 is a case of "You get a lot more that what you paid for!"

The HTX-202 has 12 independently-programmable memory channels, plus one calling and three priority channels. It comes with continuous tone squelch encode -AND- decode. Power output is 5 watts minimum (7w typical) with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1 watt output. A power saver circuit with programmable 1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories store any offset, and any combination of continuous tone frequencies.

Supplied with Nicad battery, charger, 6-cell alkaline battery case, antenna, wrist strap and belt clip. Features include:

* True FM modulation (not phase modulation) for outstanding transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz, and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

From an Owner: "I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of downtown Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!"

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because the HTX-202 is purposely limited in coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end RS could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to MAXON, a Korean entity. MAXON built the HTX-202 for Tandy, under license from Icom. The HTX-202 is sturdy and well constructed.

MISCELLANEOUS NOTES: Some HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

I appreciate that tip; my display has started going weird just
occasionally, usually when the temperature in the car is high.
I'd wondered if this was a symptom of the internal backup battery
getting low, but some slight mechanical problem like you mention sounds
more likely. My 241A is also about 3 years old, and apart from
this occasional problem still working perfectly. Thanks for the tip.

The line current is specified as either 20ma or 60ma. The older
equipment used 60ma loop current. I am not sure, but I think these
are industry standards. To get the 60ma use 1k-2k ohm adjustable
resistor (of sufficient power rating) in series with about a 100VDC
supply. [Don't hook a 100VDC supply up directly to the selector magnet
without the current limit resistor!]

From: w8gmh@barf80.nshore.org
Message-ID: <NFoN4c1w165w@barf80.nshore.org>
Source record: 218716

Recently I checked the accuracy of two Bird wattmeter slugs against
each other. One was a 1000H and the other was a 2500H. I was surprised
to see that there was quite a difference in the reading of each slug
when comparing against each other.
In one instance the 1000H read 1000watts and the 2500H read 900watts
another the 1000H read 1000watts and the 2500H read 875watts
another the 1000H read 1000watts and the 2500H read 850watts.
I wonder if anyone else had made these types of comparisons between
different Bird slugs. I thought the accuracy of the Bird stuff was
pretty close! The swr working into in each case was abt 1.2 to 1
and dont know which slug was really accurate, just concerned about
the large difference between them. Any responses on this matter would
be appreciated.

I saw some Proxim radio modems, which originally sold for $599,
listed at $99 (a few years old). Speed rated at 19.2 full duplex,
indoor range 500 feet. However, an officer of Tetherless Access
tested them and achieved 2 miles with decent antenna and inline
resistor, and predicted 7 miles range outdoors.

This was in Midnight Engineering, which is on the stands at Tower Books.

I am a great fan of Standard radios and currently own two of them. When I first saw the ad for this radio, I called Standard to find out more. I was SHOCKED to find out that the 1.2gHz band limited to <50mw! How useless.

Why in the world would they waste their time making a radio with such low power that it is useless for all practical purposes? And then charge a premium to boot?

My Yaesu FT-911 is limited to 1w, and even that is very marinal for hitting repeaters. 35 (or 50) mw is a joke.

C'mon, Standard - make a REAL tri-band unit! One that we can use on 1.2 for something other than receiving. Make it put out at least a watt and I'll buy it.

: I have info on the SGC-230, but nothing about the Yaesu unit. I need to know
: what type of network the FC-800 is using ("pi" vs. "T') in the RF coupler. Also, any
: additional information will be helpfull (weight, size, memory, input current, operating
: temperatuer ..).
: Thanks very much for any reply.

Hello,

I have the FT-900 / SG-230 combination and I'm very pleased with it.
I made my choice after talking with several people who ran HF/CAP/MARS from
their vehicles. The consensus was that the SGC product has a greater tuning
range than any of the 3 brand name units.

I have to agree, the SG-230 tuned a 102" ss whip on all but the 12m
band. I must point out that the antenna placement is critical. It *must*
be located above the roofline of your vehicle. I'm going to purchase the
SG-303 antenna (expensive) because it is designed to work with the tuner and
I can load it up on 160 meters w/o damaging the tuner.

One more thing, the SG-230 is a para-military device, very rugged,
and *most* important is that its made in the USA!

Good luck

Jim, N7TTO

From: scam@siu.edu (Scott Manthe)
Subject: C568A First Impressions...

Note: The opinions expressed here are my own,
not of Stanard Amateur Radio Products, Inc. or
Marantz Japan, Inc.

The Standard C568A is the newest of the company's dual band HT
series. The unit is a compact (measuring 134.5H x 47W x 34Dmm), high
performance dual band HT capable of full operation on the 2m and 70cm
amateur bands with a 1.2ghz suband. Dual in-band receive/transmit (VxV,
UxU, VxU and UxV, Vx1.2, Ux1.2) is possible on 2m and 70cm, with the left
side being the VHF main band and the right side being the UHF main band,
with main band performance in the sub-band. 1.2 gigahertz operation is
restricted to the right side. Output power is 2.6 watts (H), 2.5 watts (M),
350mW (L), 35mW (EL) on 2m and 440mhz at 7.2 volt with approx. 35mW out on
1.2ghz. The transmitter will produce 5 watts output at 12V DC in, via
either the optional CNB172 battery or 12V input at the DC in terminal. No
adapter is required for 12V operation.
The C568A receives from 110-199mhz, 310-399mhz, 400-499mhz,
800-975mhz (cell blocked), and 1.2-1.3ghz out of the box, no modification
needed. A combination of ceramic and bandpass filtering is used to provide
for wide-band receive and decent intermod rejection. While the intermod
rejection isn't as good as a Motorola Saber, with 9 high/low pass and 5
bandpass filters, it's MUCH better than anything Icom, Yaesu, Kenwood or
Alinco currently offer. Multiple vcos for each band provide wide RX

coverage, while insuring good sensitivity during sub-band operation. Sensitivity is rated at better than .16uV for 12dB SINAD, VHF/UHF amateur main band, and less than .18uV UHF amateur suband. (440 operation on the VHF side.) 1.2 ghz sensitivity is rated at less than .28uV for 12dB SINAD. The C568A comes with the CMU160 memory unit installed, which provides for 40 memory channels, 20 per side, but any VHF/UHF combination of memories can be stored, because sub-band (UHF/VHF) operation is possible on either the left or right side. There are sperate CALL channels for each band. All memories are capable of storing odd offsets, as well as CTCSS tone, DTMF squelch and paging codes and CTCSS squelch status. The are seven 15 digit DTMF memories for storing phone numbers or repeater control codes. (The QST ad states that there are 4 DTMF memories, but there are actually 7.) The optional CMU161 offers 200 channel operation. Memory scan is very speedy, but the number of channels per second is difficult to determine. It's not listed in the manual, but my best estimate is over 20 channels/second. During battery save operating scan speed slows depending on the save duration.
Current drain is listed as follows:

Transmit:
13.8V: 5 watts: 1.1A VHF
1.3A UHF
2.5 watts: 850mA VHF
950mA UHF
7.2V: 2.6 watts: 880mA VHF
980mA UHF
2.5 watts: 850mA VHF
950mA UHF
350mW: 480mA VHF/UHF
50mW: 100mA VHF/UHF
35mW: 120mA 1.2ghz

Receive:
Sqelched, dual band: 68mA
Suelched, mono band: 37mA VHF
48mA UHF
52mA 1.2ghz
Battery Save, dual band: 28mA
Battery save, mono band: 17mA VHF
18mA UHF
20mA 1.2ghz

Note that these are nominal specifications, NOT best case scenario figures. The actual current drain is often significantly LOWER than these numbers. This is why Standards get the better battery life.
The C568A is constructed of cycalac (what Motorola GPs are made of, although not nearly as much of it, the walls are thinner.) and aluminum alloy. The alloy back doubles as a heat sink, of course, for high power operation and to dissipate heat generated by the voltage regulator during 13.8V operation. It's very solidly built and feels rugged. The keypad is rubberized and has a positive feel. The keys are well spaced and fairly

large for an HT of this size. The keypad is NOT backlit, but the LCD is. This is intentional, as transluscent keypads tend to desintegrate with time. (Ask any Alinco owner.) The keys have a protective coating, which will prevent the numbers from rubbing off.
I haven't had a chance to spec out the receiver, but will post my findings as they happen. Of particular interest is a sensitivity curve for the out of band receive. When posted, these will be usable sensitivity figures, not the ridiculous squelch opens figures normally posted. I'll also post the out of band TX specs for those of you curious about the C568As potential as "test equipment." Stay tuned.

: I'm looking for the mods foir the HTX-202 handheld by Icom (Radio Shack). I
: heard it will blow up if I tried to modify it. Can somene advide me here? I'd

Sorry, but there is no HTX-202 by Icom. The Radio Shack HTX-202 is not modifiable for out-of-band operation.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to MAXON, a Korean entity. MAXON built the HTX-202 for Tandy, under license from Icom. The HTX-202 is sturdy and well constructed.

Subject: RS HTX 202 -- Good Price

Subject: RS HTX 202 -- Good Price or.....

>>Is this a case of "you get what you pay for"?
>>I noticed RS has the 202 on sale for 189.00, or from U.S. Radio mail
>>order for 169.00.

No - the HTX-202 is a case of "You get a lot more that what you paid for!"

The HTX-202 has 12 independently-programmable memory channels, plus one calling and three priority channels. It comes with continuous tone squelch encode -AND- decode. Power output is 5 watts minimum (7w typical) with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1 watt output. A power saver circuit with programmable 1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories store any offset, and any combination of continuous tone frequencies.

Supplied with Nicad battery, charger, 6-cell alkaline battery case, antenna, wrist strap and belt clip. Features include:

* True FM modulation (not phase modulation) for outstanding transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz, and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

From an Owner: "I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of downtown Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!"

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because the HTX-202 is purposely limited in coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end RS could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to MAXON, a Korean entity. MAXON built the HTX-202 for Tandy, under license from Icom. The HTX-202 is sturdy and well constructed.

MISCELLANEOUS NOTES: Some HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

Subject: Wanted: 2m HT for dad

Subject: Wanted: 2m HT for dad

>> I'm looking for a 2m rig for him, something
>> basic and reliable, like an FT-23R or equiv.

Get to Radio Shack this month and pick up a HTX-202 for $180.00.

The HTX-202 has 12 independently-programmable memory channels, plus one calling and three priority channels. It comes with continuous tone squelch encode -AND- decode. Power output is 5 watts minimum (7w typical) with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1 watt output. A power saver circuit with programmable 1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories store any offset, and any combination of continuous tone frequencies.

Supplied with Nicad battery, charger, 6-cell alkaline battery case, antenna, wrist strap and belt clip. Features include:

* True FM modulation (not phase modulation) for outstanding transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz,

and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

From an Owner: "I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of downtown Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!"

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because the HTX-202 is purposely limited in coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end RS could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to MAXON, a Korean entity. MAXON built the HTX-202 for Tandy, under license from Icom. The HTX-202 is sturdy and well constructed.

MISCELLANEOUS NOTES: Some HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much

burden on the Zener diodes, and generates heat at twice the normal rate.
Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while
on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN

>be appreciated.

>Ron - W8GMH

The thing to remember is that the Bird Model 43 "Thruline" wattmeter's stated accuracy is "plus or minus 5% of full scale power". For the 2500H, that would be plus-or-minus 125 watts, so at 1 kW true power, it could read between 875W and 1125W.

This is why it's always best to read analog meters as near their maximum deflection as possible for maximum accuracy. Unfortunately, since the Bird has a logarithmic scale which compresses at the high end, it may appear that reading the meter mid-scale (where the divisions are wider) would be more accurate. The same logic applies for voltmeters, ammeters, and all other analog movements.

Fortunately, 5% is not too many dB (less than 0.5 dB) so practically the differences between your measurements are insignificant.

When in the car, I do exactly what you propose. But for using the HT on
my motorcycle, I need to keep it in the vinyl case for protection from bugs
and weather. It's more of a pain to wriggle it out of the case to put the
battery on and off. That's why I'm looking for a solution that defeats the
charger, but leaves the battery pack in place to run the rig in the
absence of an external supply.

Anybody else out there know how to temporarily disable the charger, or
what the effect of disabling the 3rd battery terminal would be?

From: wave@mindspring.com (Pieter Ibelings)
Subject: Need Help Solving TS-850S RF Feedback problem.

I have a Kenwood TS-850S radio that seems to have an RF Feedback problem.
Whenever I have the processor ON, I cannot increase the mic gain higher
that 4. I have tried connecting the radio to a dummy load and a 13.8V
battery and the problem is still present. The problem is still present
without a microphone and with the monitor turned off.

The problem seems to be internal and not related to rf feedback caused by
rf on the shield of the coax since it is doing it with a dummyload. Could
this be a problem with RF bypassing inside the radio probably in one of
the mig gain stages?

IF you have any suggestions or have seen the problem before, I would
appreciate any help. This is a recent problem. I've had the radio for one
year and never noticed it.

thanks...

Subject: Packet Radio FAQ/Book/Info?

Is there a FAQ or recommended book, or any literature on packet radio?
I am most interested in the protocols used, how it connects to the
Internet, what API toolkits are available, how the nodes are
connected, what wavelengths are used, what antennae are required, and
who are the popular vendors of digital radio equipment. I have heard
of AMTOR (sp?). How does that tie in with things? I guess I am trying
to understand the entire process (every detail) of how a message that
I might send to a friend halfway around the world would get there and
be retrieved by my friend. Once I understand the process, I want to
buy equipment, get a license and start playing with the setup. As is
probably evident from my questions, I am a complete novice at amateur
radio. Any help will be greatly appreciated. Thanks!

From: jay.serafin@n9csa.com (Jay Serafin)
Subject: Station For Sale - sellin

I have the following ham station equipment for sale. Due to a back injury I suffered last year, I am finding it increasingly more difficult to sit an "play" anymore.

Kenwood TS-140S all-mode HF with AM/FM. Solid state. 100W output. 10-160 meters, all WARC bands. General coverage receive from 50kHz to 35MHz. Dual adjustable noise blankers. Speech processor built in. Full or semi QSK. Dual VFOs. Great for working splits, contests, 10 FM, etc. VOX, fast/slow AGC. 20 memories, including split tx/rx memories. RIT, IF shift Excellent working condition. Includes a 25A continuous power supply with overload/short circuit protection. Great mobile rig, if you're into that mode. Includes Kenwood MC-80 desk microphone (which also controls freq. up/down). This unit has seen less than 20 transmit hours. Have enjoyed SWL listening for more than that time, or course. No CW key included.

Daiwa CNA-2002 2.5kW PEP automatic antenna tuner, covers 10-80 meters, including WARC bands. Switchable for 2 antennas, and also has 100W dummy load built in. Cross-needle metering. Dual "fine-tuning" knobs for when you switch frequencies from where you're tuned up at. Can be "bypassed" using the front panel factory button. Works well, tunes within 5-30 seconds, with as little as 5W drive. 20/200/2k switchable metering. Works quite well, tunes with no problem every time. Fast and slow tuner motor

control.

I am also including 2 vertical antennas. One is a 5BTV 10-80 meters, the other is a Cushcraft vertical 10-80M that includes the all the WARC bands. Both tuned for phone portion of bands. Stainless steel hardware. Both antennas have NOT had more than 110 watts thru them.

Will include approx. 75' of Belden 9913 coax for each antenna.

I will not separate these items, as I would like to be able to "show" it all to a single buyer. Prefer to sell to a local ham (within reasonable driving range of Chicago), due to shipping restrictions on boxing all the items up, breaking down antennas, etc. All items are hooked up at the present time and are fully operational.

I do have the manuals for radio and antenna tuner. I do NOT have the vertical manuals available, as I lent them out, and never got them back. But, they are available from the manufacturer for approximately $10 each.

Asking $800 for complete station. Please, no trades for other equipment.

Contact me either thru my Internet address of: jay.serafin@n9csa.com or telephone me at 312-776-8448. Due to costs, I will not be able to return long-distance phone calls concerning questions about this station setup.

Thank you for taking the time to read this post.

Jay Serafin, N9CSA.

If you can't make intelligent comments, why make any at all?

So far, all the RS ham gear seems to be as good or better quality than
comparable amteur equipment from other manufacturers.

Where it's actually made, designed, or built has very little relevance to
how well it works.

OH god,

Don't ever ever ever ever try to charge a radio shaq battery in a BC35.
You will boil the battery and probably burn your house down.

Go buy the BP8 (CM8) or after market batteries.

2853. Radio Shack HTX-202 Opini

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-16 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.12517.7583.0NFB9F1F@woodybbs.com>
Source record: 218736

Subject: Radio Shack HTX-202 Opinions

>>I was wondering what people thought of the HTX-202 2 Meter HT.
>>It seems pretty good/cheap...

ON SALE this month - the HTX-202 is an EXCELLENT value.

The HTX-202 has 12 independently-programmable memory channels, plus one calling and three priority channels. It comes with continuous tone squelch encode -AND- decode. Power output is 5 watts minimum (7w typical) with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1 watt output. A power saver circuit with programmable 1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories store any offset, and any combination of continuous tone frequencies.

Supplied with Nicad battery, charger, 6-cell alkaline battery case, antenna, wrist strap and belt clip. Features include:

* True FM modulation (not phase modulation) for outstanding transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz, and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

From an Owner: "I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of downtown Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!"

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because the HTX-202 is purposely limited in coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end RS could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to MAXON, a Korean entity. MAXON built the HTX-202 for Tandy, under license from Icom. The HTX-202 is sturdy and well constructed.

MISCELLANEOUS NOTES: Some HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

Subject: Which HT?

>>I just bought a radio shack 2 meter HT...

Congratulations! Your just bought yourself a solid performer of an HT!

>>...was wondering what people thought of it...

It is a great unit for the money, Scott! Don't worry. If anyone tells
you differently, they have no idea what they're talking about.

The HTX-202 has 12 independently-programmable memory channels, plus one
calling and three priority channels. It comes with continuous tone
squelch encode -AND- decode. Power output is 5 watts minimum (7w typical)
with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power
setting provides 1 watt output. A power saver circuit with programmable
1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with
larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the
scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories
store any offset, and any combination of continuous tone frequencies.

Supplied with Nicad battery, charger, 6-cell alkaline battery case,
antenna, wrist strap and belt clip. Features include:

* True FM modulation (not phase modulation) for outstanding
transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are
independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective
paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences
for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with
programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz,
and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or
16 seconds.
* Multi-function scanning lets you scan standard memories,

2856. Icom Ic-230

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-16 00:00:00 UTC
From: Sam.Barrett@f429.n326.z1.fidonet.org
Message-ID: <575_9504172249@woodybbs.com>
Source record: 218739

CW>I just picked up an Icom IC-230 at a local flea market. All I know is
CW>the power output. The frequency range seems to be 146-148Mhz with .30MHz

Chris, you are correct. The IC-230 is a 2-meter FM radio which covers 146-148mHz with an output of approx. 10 watts. As it comes from the factory, it has offset of = or - 600kHz for repeater use or will operate simplex. The front panel off/on switch goes in the down position for offset (repeater) operation, center is off and up is simplex. The A/B switch on the top is for repeater offset ("A" is -600, "B" is +600).

CW>I would like to use the radio for packet at 144.91. Does anyone have any

The easiest way to make this unit operate on packet is to add a crystal in one of the spare sockets in the LO module. The LO module is found by removing the top cover and looking down on the top of the radio. You will see a narrow compartment which runs from the left side of the radio to the right. It contains (among other things) 7 crystals in the 13.7 to 13.9 mHz range and four empty crystal sockets. The formula is:

$$\text{xtal freq (mHz)} = \frac{\text{desired operating freq} - 11.265 - 10.7}{9}$$

A quick calculation tells me that for 144.91 mHz you want a crystal of 13.660555 mHz. Place this crystal in socket #8 (the first empty socket after the 7 crystals that come in the radio) in the LO module. Now, with the mHz selector in the 146 position (pushbutton in upper lefthand portion of front panel), and the left frequency selector switch in the "A" position, you should get 10 additional frequencies at 30 kHz spacings by rotating the right frequency selector switch.

As with any crystal installation, the frequency should be "fine-tuned" using a good frequency counter and adjusting the appropriate trimmer cap for the new crystal.

As you are getting 10 new frequencies, you may want to play with the crystal freq before you order it. IOW, you might want to opt for a lower frequency crystal to so that rather than starting at 144.91 and going up in 30 kHz steps (144.91, 144.94, 144.97, etc) you would start at 144.85 giving you 144.85, 144.88, 144.91, 144.94, etc. I don't know what might be best for you, but as long as you are adding a crystal anyway, get one that does you the most good.

Additional crystal data:
Holder type: HC-25/u
Calibration Tolerance: 0.0025%

Load Capacitance: 20 pf
Effective Resistance: 15 ohms or less
Cut: "AT" optimum angle + or- 2min.

From my experience, it pays to order the greatest precision possible. I have had some rocks for these rigs that wouldn't tune correctly without adding additional capacitance to the trimmer. Also, when dropping out of the 146-148 range, make sure you have a ps which delivers 13.5 VDC or greater. I have also had the oscillator quit oscillating when the ps voltage drops too low.

Good luck,

.........Later...

Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

>Anybody else out there know how to temporarily disable the charger, or
>what the effect of disabling the 3rd battery terminal would be?

I have never tried this, but here goes. Couldn't you take the little jack out
of the side of the battery and put a small switch in there that would
open the connection between the battery and the radio. Or you could go to
a fabric store and buy a piece of hard foam padding and cut it to the size
of the battery, and just remove the battery all together. THis is what I have
done so that my FNB-25 fits in the same case as the FNB-27. If you did the
first mod you would have to have the rapid charger to charge the battery since
you would be removing the jack.

Good Luck, and Let us know what you do.

The Tx VCO is more limited than the receive. You have probably reached the top, unless you want to retune the VCO. Then you will have trouble using it within the amateur bands. The Rx will go all the way to 900, with a few holes. Tx will not.

2867. Crystal filter passband ripple

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-17 00:00:00 UTC
From: dgf@netcom.com
Message-ID: <dgfD76ouE.HyG@netcom.com>
Source record: 218656

I just installed a CW crystal filter in a FT301SD. While I was playing around with the rig, I suspected some passband ripple. I plotted "S" meter readings vs. frequency of the calibrator signal for both the SSB and CW filters and noticed an unexpected dip and peak moving upwards in passband _on both filters_, with ripple of 10 dB or so. I don't think they are interfering with eachother (I removed the CW filter and rechecked the SSB filter which exhibits the same behavior). The design doesn't seem to have filter input/output matching transformers (the correct filter is selected by diode switching). I've never encountered such severe passband ripple before (it's enough to affect the received audio, and for the CW filter the result is two peak frequencies within a few hundred Hz, reducing the total available selectivity). I'd appreciate any advice on this topic and hints if there are external (to the filter's guts) ways of reducing this. The IF is 9 MHz.

Message-ID: <0803170917041995.A08439.BETA.11948A510200*@MHS>
Source record: 218657

I have a Heath SB-102 for sale. Serial # is 010 4814, with original manual, loads of QST articles, including original review. Used for a few hours during the 1995 CQ WW WPX contest and worked 72 stations in over 40 countries, including most of Europe and South America with a fairly poor long wire antenna and tuner. Rig is in very good physical condition, inside and out. Has not been used often during the past 5 years.

It comes with CW filter, HP-23A power supply w/manual, HP-13 Mobile DC power supply (no manual) and SBA 100-1 Mobile Mount w/manual (a few small parts seem to be missing).

Asking $195 + shipping

This is a heavy station and local delivery/pickup would be preferred - greater Washington, DC area.

73,

Steve, Reston, VA, N4EUK sslavsky@acq.osd.mil

>Want to make one for 223.300. Any opinions welcomed..73..JIM

Jim,

these things really do work! I made one out ogf a big lug-terminal
and a 1/4 wave (19") length of braid. It really makes a difference
on xmit and rx. Beware of the additional space needed for the lug
between the antenna base and the rig, this can mess up the bnc if it
puts too much strain on the connector.

2876. Kenwood TM733 vs Yaesu FT5100/5200

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-17 00:00:00 UTC
From: sem2r@galen.med.Virginia.EDU
Message-ID: <D770AF.33B@murdoch.acc.Virginia.EDU>
Source record: 218665

I have a Kenwood TM733 that I'm basically very satisfied with although I don't find the unit to be highly "intuitive" or as "user friendly" as it could be. Intermod is not a major problem in my area, but I occasionally drive through such areas.

In thinking about a second dual bander for my other car, I'm also considering the Yaesu FT5100 or maybe the detachable-front FT5200, but the latter also lacks some features of the FT5100. Although I'd be inclined to stick with the TM733 so that my internal "CPU" only has one setup to deal with, if there are good arguments for the Yaesu rigs, like the built in diplexer, ?better intermod rejection, others I'd love to hear them.

Thanks!!

>Just picked up a used HTX-202... Wondering if there are any mods available?

NO mods exist or are possible. This radio was designed to recieve the 2M
ham band only, and has a very narrowband front end. It would be deaf
outside the ham band.

But it has the best intermod rejection around.

NOTE: I have no connection to Radio Shark or the Chinese Comminist Party.

Hello:
I also have tried the SGC-230, first using hamsticks, then
with the SGC-303 antenna. The antenna is expensive, but very rugged.
It should last indefinitely. The combination will load up on 160
meters but it is very inefficient. I works reasonably well on 75
meters and very well on 40 meters and above. The ability to go
from one band to another instantly, and its maintenance-free
installation are well worth the steep price.

> American Fork, UT DoD#1461

So far we've learned:
1) don't leave nicads on trickle charge when charged.
2) don't leave fully charged.
3) always discharging completely may shorten battery life.
4) don't partially discharge to the same point repeatedly.

Q: Is there a problem if the battery is recharged partially (ie not to full charge)? once? repeatedly?
How do you figure the recharge time if partially discharged. (700mah on 60ma trickle charger = 12 hours no matter what discharge?)

2881. 800MHz on any HT's?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-17 00:00:00 UTC
From: whitehes@spot.Colorado.EDU
Message-ID: <3muges$bt5@CUBoulder.Colorado.EDU>
Source record: 218670

Hi Folks,
I know this subject has been covered before, but does anyone know if
any of the currently produced HT's have a mod for listening to public
safety 800 MHz as well as 450-512 MHz.

I have asked this question before, but really did not get satifactory answers.
I know that the FT530 older models do cover 800 MHz, but what is the cutoff
in serial numbers? Perhaps I am just wasting my time and should just buy
a scanner but I would rather have an HT and scanner in one radio.

Thank you for any help. Please e-mail with a reply.

Hello everyone out there in cyberspace..
I have been thinking about all the talk that fellow hams have been making
concerning the possibility of all of the new radio shack products.
I think, and I stress the I, that this is a brilliant maneuver by radio shack t
o come out with these products. 2m mobile, 2/440 mobile 6m unit. Radio shack
is being very clever, since that they know that they are most likely the ONLY
radio store in the Area, they can flood the areawith their products. No
competition, big profits.

Just doing some thinking....

2883. Bird Accuracy

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-17 00:00:00 UTC
From: Waltk@pica.army.mil
Message-ID: <9504171725.aa08123@COR5.PICA.ARMY.MIL>
Source record: 218672

Ron W8GMH writes:

>Recently I checked the accuracy of two Bird wattmeter slugs against
>each other.

>In one instance the 1000H read 1000watts and the 2500H read 900watts
>another the 1000H read 1000watts and the 2500H read 875watts
>another the 1000H read 1000watts and the 2500H read 850watts.

Bird guarantees accuracy to (I believe) 5%. Thats 5% of Full Scale.
Since 1000W is about half scale using a 2500 watt slug, the error
is 10%. 10% of 2500 is 250W so any value between approx. 750-1250W
is within spec. But, I understand your surprise since the device
is pretty expensive and one would figure the accuracy would be
better than what it is. I have a 50W slug that was calibrated
professionally using a calorimter. Now I know how much my 2M rig
puts out. (Big whoop!;^)

>I have a new yaesu 5100. The Microphone that comes with it with the key
>pad is not mentioned in the manual. There is a "p" key. can this key be
>programmed to change bands on the radio remotely. I have a hrd time

No. Check out the mod files for the 5100 on the various ham ftp servers.
If you need them with the next week, I can email them to you -- after that
I'm off the net until my next job. I recall that the 'P' key is s'pose to
be for a future rig and currently has no function. I doubt that but....
who am I to say. :-)

Also, in the mod files you should find a mod to change the D/MR key to a
band switch. I think it's a matter of making/breaking a jumper inside the
5100. Personally, I'd rather have the 'P' key do this but I don't really
need the D/MR key on the microphone either -- I, like you, would rather
have a band-switch button.

Good luck!

Dave,

I had a similar experience with my FT-101E. Apparently the input and/or output of the filter is not matched properly. I would suggest a small trimmer cap across the input (30 pf or so max) and try adjusting for best ripple response.

I have not tried this, but it's what I would have done had I had the time to experiment.

>most suitable? Does anyone still manufacture transmitters? What about the

yes...after a fashion (some kits out there.. and some commercial concerns)

>6 and 2m bands? I would like to add to my existing equipment rather than

6 and 2-- the new crop of HF radios include 6 now it appears. 2m is far enough away from HF that usually the manufacturers sold 'em as separate radios...can't get a final to easily/cheaply cover 1.8 to 150 MHz with good performance...

>investing in a new transceiver.
> Thanks,
> Chris

the kicker is that the modern transceiver has been around long enough that there are those that have never seen a "separates" station. there's a lot of details that would need to be addressed with the mix of a random receiver with a random transmitter that makes it a pretty big job when you're starting out. I might suggest you keep the R8 a 2nd receiver and get a used trans-ceiver to start with just so you can get started.

Hi all,
I recently acquired a military surplus Racal RA-6790
(military nomenclature R-2174(P)/URR HF receiver.
When I got it, it was working great. After a couple
days (intermittent usage), the display suddenly showed
a strange combination of letters/numbers and now the
receiver is dead. On LSB, there is hiss and the fault
light. On the other modes, nothing (except the dial
lights). Also, the various bandwidth filters will no
longer switch in and out. Processor problem/lockup
maybe? Anyone got any clues? It WAS a nice receiver
and I'd like to get it working again....

Source record: 218598

My HTX-202 HT went on the blink this morning. Started blinking
"Er2" and beeping. I checked the internal battery and its 3.0v.
I tried the F-CLR power up to clear out the ram, but no help.

What is a "Er2" error code?

Greetings!

I've purchased a CU-872A/U antenna coupler (formerly used by the US
Navy) and I am wondering what type of connectors are used on this coupler.
The coupler has one connector for the antenna and can be hooked up to 8
receivers. If anyone has info then please email me.

Thanks

2916. Use of Coax switch for xcvrs

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-18 00:00:00 UTC
From: ham@wam.umd.edu
Message-ID: <3n0r56$3vk@cville-srv.wam.umd.edu>
Source record: 218604

I have a setup in my shack where I have just hooked up
three xcvrs to a 3-to-1 coax switch. Unused positions
are automatically grounded.

Given the claimed 40 to 50 db attenuation between
the 3 inputs, should I be concerned about this setup
potentially blowing up one of my radios?

Just how much can the front end take (yes, I know
Yaesus use a fuse, I have Icom, Heath, and Ten-Tec)
before popping? 40-50 db = 1/10000 to 1/100000 of
the 100 watt max power I'll be running, equating to
a worst case secnario of 0.01 watts at the input.

Yes, at DC that's V^2/Z = V^2/50 = 0.01 meaning that
V dc = 0.707 volts. Then the ac equivalent peak voltage
is exactly 1 volt.

Comments? Recommendations? Is my math right? Is this
safe? MFJ sells such a product, too, and I wonder about
its safety as well...

>Shel WA2UBK

I pulled the schematic myself, but couldn't tell much. All three
terminals disappear into an IC with not much explanation.

I put a voltmeter on it the other night, and found about 10.7v
between the +/- terminals to the battery from the radio. The
same voltage showed between the 3rd terminal and the -. From
this I can't tell much, but it doesn't seem likely I could disable
the charger by blocking the third terminal. Still looking for any
answers if anyone knows.

Thanks and 73.

> investing in a new transceiver.

Chris,

As I recall, the R8 does have a muting terminal, so you can silence the receiver with a relay when you key the transmitter. Before the age of transceivers, we all used separate receivers and transmitters. It obviously isn't as easy as with a transceiver as for one thing you have to be concerned about having the transmitter and receiver on complementary frequencies.

Go for it!

>charge)? once? repeatedly?
>How do you figure the recharge time if partially discharged. (700mah on 60ma
>trickle charger = 12 hours no matter what discharge?)

Generally there is no problem with partial discharges or charges. Usually if the battery is about 1/2 discharged and I need a full charge out of it, I will put it on a slow charger for about 10 hours. Slow chargers are best since they are very forgiving of overcharging. Doing partial charges or discharges every once in a while will have no detrimental effect on the overall life of the battery. It is not necessary to fully discharge a Nicad every time you use it. Now if you are using a 1 to 4 hour fast charger, then things change. Overcharging (the primary way to kill nicads) becomes a real issue.

This new band isn't like most ham bands, which you can just pick an
empty frequency, and get on. This 219 band is a coordinated freq
assigned for packet and other digital modes. For packet backbones
and links. We are second users who have to share and not interfere
with another user (government, I think). People who do repeater coordinations
will coordinate this band.

From page 36 in the manual:

Er2: PLL Unlock Error

Er2 indicates the transceiver's PLL section has unlocked. Have the transceiver repaired by an authorized Radio Snack (sic) service center.

(just hope they don't drop any of their "snacks" in the radio while they fix it...)

2925. Motorcycle Mobile Followup: Results!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-18 00:00:00 UTC
From: kreifels@intel.com
Message-ID: <kreifels.798236469@fmwu23>
Source record: 218613

(This post has also been sent to the ham-tech mailing list. -JAK)
Folks,

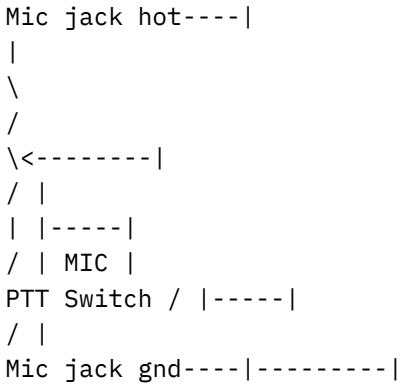
To all interested, this is a summary of my installation of a UHF/VHF handheld on my motorcycle. I posted a series of questions regarding this some time ago, and thought the results might be of interest.

The bike is a 1990 BMW K75S. The radio is a Yaesu FT-530. It is mounted on the handlebar pad in the Yaesu mobile mounting bracket. The handlebar pad is made of a dense foam (similar to an automotive dash) and provides a fair amount of vibration damping. I currently have the bracket mounted with two large zip-ties, but will eventually replace it with something more long-term reliable. I intended to use nylon straps with quick-release buckles, but the buckles were too bulky. Current plan is to use nylon straps with 3-4 inches of overlap secured by velcro. Two straps will be used for redundancy; if one lets loose, the other should hold it so it doesn't fall off. The rig sits at about 45 degrees, which is a good angle for viewing and button punching.

Headset is scrounged from a Nady rider to passenger intercom I had in the garage. I believe it is a 600 ohm electret mic element, attached by a flexible boom to a small 32 ohm speaker. It fits snugly inside my full-face helmet without permanent attachment. Crushes my ear a bit, but it is workable. The mic sits in contact with both the chin guard and my mouth, so space is tight.

I rigged an adapter for this headset to interface to the radio. The headset has an 1/8" stereo plug which I wired to a set of stereo plugs to the mic and speaker jacks on the rig.

Additionally, I placed a 2.2K trimmer pot with a PTT switch as follows:



The pot provides the 2.2K resistance needed by the FT-530 to trigger the PTT circuit, and also allows me to reduce the mic gain. I've needed to do this as the mic is hotter than the rig wants, is really too close to my mouth, and picks up wind noise which I want to minimize. I'm still experimenting with the mic gain, but expect my best results will be to set it low and speak loudly to keep the wind noise down.

The PTT switch is a momentary contact paddle switch mounted with zip ties near the clutch lever. I trigger it with my left index finger. I am considering adding a parallel switch to lock the PTT on. This is primarily so I can turn autopatch access into a one-handed operation. (Need to hold PTT and press DTMF memory key simultaneously.)

Currently, I connect a 10" peice of coax to the BNC on the radio. The other end of the coax contains a BNC connector for the ducky antenna. The connector is mounted with zip-ties to the mirror post. The base of the duck is protected from wind by the small sport fairing, but the whip is out in the wind. It does flex a lot; I am hoping this will not cause antenna failure in the long run.

I plan soon to add a real mobile antenna, probably a Comet or Diamond with fold-over feature. This will be mounted either by epoxying a metal plate to the top of one of the hard cases at the back of the bike and using a mag mount, or with some other mounting scheme probably attaching a bracket under the rear fender.

I had some difficulty in wiring a power adapter to the bike's battery. I had one of the Yaesu power cords, and tied it directly to the bike's battery terminals with a 5amp fuses in both + and - leads. I found that on 5watt and 3watt output, this caused the engine to miss, as though it was interfering with the on-board computer. At 1.5watts, no problems. An external 12v battery caused no engine problems at full 5watts, and poking the antenna around all the vitals seemed to cause no problems. I concluded my problem was not radiated RF, but RF travelling down my power cord into the bike's electrical system. A Radio Shack snap on ferrite core with two turns of the power cord cured this problem.

I keep the radio in one of the carry cases while in its mobile mounting bracket. This protects it from bugs, water, and sun. I would prefer to keep the battery connected in the case, so I can just pull it out of the bracket, screw on the ducky, and have a handheld. The problem is, don't want the built-in charger to continuously top the battery. I am still trying to resolve this one.

QUESTION:
Does anyone know how to temporarily disable the internal battery charger while leaving the battery pack connected? What will happen if I block the 3rd terminal on the battery? I presume this is used for charging, but I don't know exactly how. I'd like to keep the battery in place, and plug the radio into 12v without it charging the battery.

At this point, my main problem remains wind noise. It makes it difficult to understand a received signal if the audio is low or noisy, and of course it gets into my transmitted audio. A new helmet would probably cure this, but I'm not ready to invest in that yet.

Thanks to all who offered suggestions and help. I hope someone else out there can benefit from my experiences here. I welcome any questions, comments, or suggestions.

Has anyone seen the article in the latest Worldradio that's titled:
"NiCds: Memory myth"? It is written by Dean Manley KH6B and he reports
there is no such thing as the memory effect in NiCads, claimed by Gates
Energy Products (battery vendor). Gates has run tests which show no
effect at all and claim that the myth was based on "one observation of
a single battery in a lunar NASA mission".

I have read (somewhere) that the so-called memory effect is caused
by overcharging the batteries.

Actually, I don't know who to believe at this point.

For what it's worth, I use an electric razor with Nicads, and after a few
months of daily usage (recharging continuously) it would diminish motor speed.
After disposing of several razors with this same failure mode, I decided
after reading the KH6B article that I would run the razor to nearly dead
state, then recharge it for 24 hours. After doing this, the razor has
essentially the same motor speed as it was new. Dean's article saved me $$.

: The antenna will be a Cushcraft mag mount. Here are the ones I am looking
: at now:
: Yaesu FT2500M

I just picked up an FT2500M myself. I paid I think about $350 for it,
new. This makes it more expensive than most other basic 2 meter mobile
rigs, such as the Kenwood 241.

The FT2500M is built to mil-specs, which is basically why I chose it.
I'm a clumsy fool and I spill stuff and throw stuff around the car and
basically don't want to trash the radio. The 2500M is a nice solid
radio which feels like it could take quite a beating. All reports from
the receiving end are that it sounds great. Receiver is top-notch,
picks up real well and is very sensitive. Controls are pretty much
sensible and is easy to operate without really ever looking in the manual.

Just my 2 cents on the FT-2500M.

From: dfleming@earth.execpc.com
Message-ID: <3mv9l5$nq4@homer.alpha.net>
Source record: 218621

My friend has the Yaesu ft-840 dual bander and was trying to find the mods for the radio.

Any help is appreciated....

2934. YAESU FT-11R...HELP

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-18 00:00:00 UTC
From: dfleming@earth.execpc.com
Message-ID: <3mv9si$nq4@homer.alpha.net>
Source record: 218622

Can I run this little HT while it's dropped into the charging unit and while the battery is in the radio? There is not a AC jack on the radio so I was wondering if there is some sort of regulation built in so I could use the charger as the AC adapter.

Thank You
-dan

2935. HELP - Motorolla HT800

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-18 00:00:00 UTC
From: David Whitehead <david@medsin.demon.co.uk>
Message-ID: <D794vK.8rI@demon.co.uk>
Source record: 218623

Hi, a friend of mine has several HT800 I think they are PMR or something like that?

Anyway what he wants to do is the following:

1.Reprogram them with software (does anyone have this)

2. Change them from duplex to simplex

Any help would be greatly appreciated as he is not on the Net (yet)

Please e-mail me direct at david@medsin.demon.co.uk

The only potential problem I see here is that the HTX-212 and HTX-404 were in the rumor mills for almost a year before they were available. I was in Radio Shack yesterday and finally saw the HTX-212 mobile rig. Very nice and most of the front-panel buttons are also on the microphone, yet the microphone isn't overly large and buttons are a nice size -- at least for my hands. :-)

I also noticed the HTX-202 is on sale for $189.

2937. Re: FT-530 Batt. Pack: disabling internal charger?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-18 00:00:00 UTC
From: glenk@DSG.Tandem.COM
Message-ID: <3n0odf$knp@newshost.loc3.tandem.com>
Source record: 218625

The third (or middle) contact provides the charging current.
As another ham mentioned, the FBA-12 AA pack does not have this
terminal and cannot be charged thru the radio. The standard
FNB-25 has a diode attached to this terminal internally to
provide a path for charging current yet be reversed biased against
voltages applied by the drop-in or wall charger.

It seems like placing a piece of insulating tape over this terminal
would provide the solution but I suggest possibly making an external
voltage regulator that drops the DC Input voltage to a level where
charging doesn't occur (~8.5-9V) and switchable to straight 12V when
desired....It wouldn't be that complicated of a circuit.

I don't know BUT the very narrow front ends that make
the radio shack stuff intermod resistant are just what
you don't want for 9600. Consider this when making a selection.
Read the month's QST there is a very good comparison of 9600
baud ready radios.

2940. What is HTX202 "Er2" code?

Newsgroup: rec.radio.amateur.equipment

From: gianotti@aol.com
Message-ID: <3n1qgv$d2s@newsbf02.news.aol.com>
Source record: 218632

Get the Yaesu. The display is easier to read (more contrast) and lighs up much brighter at night. Also the receive audio is MUCH better. The W21AT receive audio is terrible, ICOM claims they have a PC board that covers much of the speaker. With an extrnal mike the audio is OK. Also, the Yaesu has the display mike.

Get the Yaesu.

>competition, big profits.

Interesting thought. So? Nothing wrong with a little free
enterprise, is there? The dual band and 6m units are only rumor at this
stage. As far as "no competition" I don't think so. Since every major
(and a lot of "not-so-major") ham dealers all have toll free 800 numbers
few hams buy rigs without a lot of comparison and price shopping.
I figure that if RS can market the stuff successfully, i.e., bring out
decent equipment competitively priced, of course they'll succeed. The
hams will also be happy. If their equipment turns out to be no good
or too expensive, it won't sell and they'll fail. Simple market
economics. They won't be able to "flood the area with their products"
unless the consumer is willing to buy them! And as fussy as most hams
are, if the products end up being no good the whole world will know
about it in very short order! I say, more power to 'em and bring on
more new gear!!!

efforts.

Gerald, it sounds like the TNC is doing fine (at least receiving), "T:"
will only increment on valid KISS packets from the TNC. The "F:" and
"D:" boxes should be incrementing also. If "D:" is incrementing on you
can't call up the directory with ViewDir, you may want to check your
subdirectory assignments for each satellite.

BTW, you can turn off the KISS file option (it just clutters up the HD).

>I would guess I have something set wrong but I can't figure it
>out. For the first effort I am just trying to get a directory
>so no joy. Any help will be greatly appreciated.
>By way of my contribution I played with the mike drive on the 736
>with the deviation meter in line and found no change in deviation.

Maximize the mspe window, so that you can view everything coming from
bird and try sending some manual fill requests (directory or file,
doesn't
matter) to see if the bird responds. If no OK's or NO-1's, then you're
not
making it. You may want to look at your 736 mod to the varactor or your
cable from the TNC to the radio.

Just some ideas, hope they help.

2960. Kenwood TS-440S: Advice Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-19 00:00:00 UTC
From: paul@morganph.pdial.interpath.net
Message-ID: <paul-1804952203550001@morganph.pdial.interpath.net>
Source record: 218548

Hello,

I inherited a Kenwood TS-440S transceiver from my father-in-law about two years ago. Recently I took a ham class and passed my Tech + tests. I am trying to get ready to work 40 meters CW and can't get the 440S to output CW when keyed. My father-in-law was a SSB'er and had an Extra class license. It is possible that he modified the rig in some way that could interfere with xmitting CW. I have read the manual and followed the directions for CW operation to the letter but just can't just it to xmit CW (although it receives CW just fine). Phone operation also seems to work just fine when applied to the dummy load.

If any of you out there have any suggestions or ideas, they would be greatly appreciated.

Many thanks in advance and 73's,

Paul Morgan

> >to allow reception of the National Weather Service stations on 162.45MHz?
>
While mods DO exist, this involved, among other things,
re-tuning the PLL to allow for lock at 162 MHz.
However, depending on the radio, and if not done right,
this will cause the PLL to emit suprs on the "low end" of
the lock range, usually in the 144-145 MHz band
(repeater inputs and simplex).

These spurs are every 5 KHz, and I've seen them as bad as
only 10 dB down from the carrier. Sometimes the recieving
station will notice a "high pitched whine" (but not very
audiable) on your signal. If it's this bad (for someone
on simplex to notice it), it's VERY bad on the RF side.

Remember, if you're operating on a repeater, you have
sidebands that may have enough energy to key repeaters
+/- 20 KHz from your input frequency.

If you DO decide to mod the radio, tune the PLL so that
it does not lock any higher than 162.6 MHz, AND have
someone check the low end with a spectrum analyzer.

>I tried the F-CLR power up to clear out the ram, but no help.

>What is a "Er2" error code?

In addition to the other responses, RS put out a service bulletin of some kind noting that this occurs most often when you use the rubber duckie antenna with 13.8V...it overloads the PL in the receiver. If you're using 13.8V, they recommend using an external antenna. If this does't clear up the problem, say hello to the Tandy Service center.

Good Luck!

I think a new helmet would, as you say, eliminate or at least reduce your wind noise problem. You might consider the helmets that come with motorcycles that have an intercom system built-in so that two rides and communicate easily. This way, the mike and headphone units and built in and provide enough space for your head that your ears won't be squished.

Well, congratulate yourself, JBaack, because you've just gotten a pretty
good grip on the capitalistic model of economics!

See a need -> fill the need -> make money!

Knowing quite a few of the folks at Tandy/Radio Shack, I know that many of
them have been wanting to return to the amateur radio vendor's club for a
long, long time and its only been relatively recently that the corporate
culture has allowed that to happen.

I hope the future plays out like some of the folks are projecting. If so,
it's gonna be real interesting!

Source record: 218567
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

Ken and all who offered help,

It is running now. The problem was with the KPC-9612. WISP
needs to be able to access the extended KISS instruction set
and use port2 apparently the 9612 defaults to port1.
What I learned is there are a couple of things that have to be
done form another terminal program before MSPE runs.

The TNC interface has to be in terminal for you to be able
to access these commands. If they won't work type "int term"
from the cmd: prompt. The TNC setup commands are:
maxusers 0/1 ;this locks TNC to port2
mydrop 1/0 ;this allows the extended KISS command set on port2

When this is done get out of your terminal program and start WISP as usual.

:note the maxusers may not be necessary I will experiment and
report. With the new WISP you can do this from within the program
I expect to get this done this weekend and will post instructions
Monday.

73 de Jerry finally on the birds.

EarHuggers by M-Squared 'The Science of Comfort'

- EarHuggers are not headphones.
- EarHuggers are not earbuds.
- EarHuggers are a new and different system for comfortably listening to music while involved in any sport or activity.

EarHuggers ($19.95) are made of a soft plastic which fits around the ear holding a high tech speaker comfortably in place. A specially designed groove on the side of the EarHugger allows the M-Squared earbud cord to be locked securely onto the EarHugger frame. While earbuds fall out during exercise and headphones fall of or slip, EarHuggers stay securely in place through the most rigorous activities.

EarHugger Frames ($6.95), the soft, flexible plastic piece without the earbud, will be sold separately in a variety of colors- including yellow, black, and teal. These frames are designed specifically to fit M-Squared ear-buds and allow flexibility in matching Ear-Huggers to different sports outfits.

Please refer to the advertisement in the Atlanta Guide & E-Mall located at http://clever.randomc.com for further info on EarHuggers Headphones!

Contact: M-Squared at 1-800-487-0135 for ordering and information.

2984. ICOM IC-736 DDS/VCO Bug/Fix

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-19 00:00:00 UTC
From: sgorecki@feldspar.com
Message-ID: <3n3ghl$lb9@snoopy.feldspar.com>
Source record: 218572

I have just received confirmation from ICOM Canada that there is a bug in the design of the IC-736 with respect to frequency generation. It seems that although it seems to be a common problem, not all IC-736's exhibit the problem. It seems that there is a "floating" data/address line and at times it floats the wrong direction, giving about 30HZ (maybe 32HZ?) difference in LSB mode. The fix is to solder a 47K resistor between pins 17 and 10 on IC24 on the main board. (bottom of radio, near front). I have not yet tried the fix, as I just got it today.
To see if you too have the problem, try the following test:

1) switch to AM first and tune to a strong AM carrier, and switch to LSB (once and only once) 40M is a good place to try this.
2) tune the carrier to about 400HZ tone and listen carefully.
3) switch to USB and back to LSB quickly. You should hear a different tone. If not, then you are "floating" in the right direction.
4) switching to USB and back to LSB will not produce any more differences. You must LEAVE SSB mode (ie AM) and come back to LSB for the first time to re-set the "floating" line. It is the LSB/USB/LSB switch that shows the difference in the two LSB received frequencies (by tone only, the display does not change...)

I've tried to post this message about 4 times so far with no apparent success. Hopefully this one will make it....73's and hope that helps someone

Greetings,

I am in the process of getting an HF rig, and a guy I know wants to sell a TS-180.

I am requesting a little info on it, opinions and if possible what is a good price on it w/o a ps.

I'm in need of a part # or description of transistor Q4 in an alinco dr110-t.
It's located on the display/control board in close proximity to the main
power switch.
Anybody have a schematic or part list?

Thanks in advance!

Subject: HTX202 NOT MODIFIABLE

Greetings HTX-202 Fans:

It seems that human nature dictates that every major item we purchase be "hot rodded" into something other than what the manufacturer intended. Our first car, our first radio, and now: the HTX-202. Regardless of the total lack of necessity for most owners, everyone wants to broad-band the 202.

Perhaps in our evolution, there is a little CB radio mentality left under the surface. Who knows? But hopefully, I can answer a few questions which have yet to be answered to the ham community.

The HTX-202 is based on the ICOM 02AT with certain design modifications besed on Tandy's specs. These variations include encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to their usual Korean source for cheap gadgetry: MAXON. Maxon then built the 202 for Tandy, under license from Icom. The HTX-202 is surprisingly sturdy, and well constructed, considering that Maxon has the worst quality control in the industry.

Be that as it may, before Tandy would produce the 202, certain specs had to be met. Foremost, after the repercussions from their 10-meter rig, Tandy insisted that the 202 NOT BE CAPABLE OF MODIFICATION! Period.

This worked out well, as the tighter bandpass gives the 202 it's exceptional selectivity and immunity to intermod. When you brag to your friends about your tight front-end, just remember that the cost of this important function, is the lask of ability to kerchunk your local police department's repeater. Why complain anyway?

Most 202's will not take a BP-7 Icom pack. The BP-8 usually works well. If the Zener diode in the bottom-feed circuit is bad, only a 9.6-vdc pack or less will work. A minor headache at the very least.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio... Take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

HIDDEN FUNCTION: Holding the <F>unction button while depressing the <L>ight button will cause the display lighting to remain on until the <L>ight button is pressed again.

HELPFUL HINT: Discard your belt clip... Install a commercial H.T. "D-swivel" available at any FM 2-way Business Radio dealer. Add the mount to your belt, and VOILA... No more dropped radios.

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER. NEVER, NEVER, NEVER!

DESIGN FLAW: Some early production (S/N 2500 and down) radios had the NiCad Zener Diode located too close to the finals, causing final transistor failure when used on external DC with the pack in place. This was remedied in production, and Tandy will remedy under warranty.

Hopefully, this will address all remaining questions and rumors in regard to the HTX-202. It can't be modified. Big deal! It is a sturdy, well-built, dependable radio and a bargain at the price. Be happy with a great deal on a great radio. My HTX-202 got me through in an emergency situation, where my 800-MHz commercial trunked radio failed... That's more than enough for me!

2993. Re: Replacement 2m HT Antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-19 00:00:00 UTC
From: wdh@Eng.Sun.COM
Message-ID: <3n3oks$pjr@engnews1.eng.sun.com>
Source record: 218581

I like the Larsen version of the 2 meter hot rod. This unit unscrews in the middle and creates two shorter pieces. Thus it fits inside the small nylon carrying bag (actually a camera bag that I bought at the local drug/variety store) that I use to carry the HT and accessories.

A ~15 inch flexible 1/4 wave might be a good choice if you plan to use the HT while walking around. It won't strain the antenna connector like the 1/2 waves.

I've also thought of getting MFJ's 3/8 wave. This telescopes down to about the size of a writing pen. I think it is about 24 inches long and much less weight than a 1/2 wave as well...

Finally, I used a ~ 8 inch ducky antenna on first HT. It worked much better than the stock ~4 inch ducks. I miss that antenna.

...Dennis "my HT doesn't leave home without the 1/2 wave" Henderson, N6TTW

There is Windows shareware available for decoding DTMF tones using a soundblaster card, so someone might have DOS software somewhere. Good luck in your search.

Source record: 218585

Dan Fleming wrote:

> Can I run this little HT while it's dropped into the charging unit...

The charger is only a charger, and cannot deliver nearly enough current
for transmitting. You can probably monitor while charging, but you will be
charging at a lower rate, as some of the energy from the charger will be
going to power the radio. The only real way to externally power the FT-11
is to buy the DC-DC converter they sell for around $60.

Wow! This was one of the only functions I *really* wished this radio had
and now, it has it! I never thought to try and press f+m-clr AGAIN to
bring it back. I tried mine by clearing several channels, scanning, then
turning the radio power off. Then, I powered up and brought all the
channels back!

Thanks,

2999. Re: Drake R8 with transmitter

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-19 00:00:00 UTC
From: trapps@hpcc01.corp.hp.com
Message-ID: <58520003@hpcc01.corp.hp.com>
Source record: 218587

Hi,

My guess, would be the R-8 would be OK if:

a) The transmitter has a Transmit-Receive Antenna switch, or it can
be added using logic signals from the transmitter.

b) The R-8 can go into Mute/Standby, preferably with the same switch.
This may not be necessary for QRP.

c) I'd feel better if it were in a metal box with coaxial connectors.

I don't own an R-8, but those would be my decision criteria. You could
add switches yourself, but more than just the mike button gets old pretty
fast, and you could zap your finals or receiver if you goof up.

Steve, N4DG

3000. CAT-1000 Repeater Controller for Remote Base w/ TS440???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-19 00:00:00 UTC
From: wx2l@aol.com
Message-ID: <3n43b2$sao@newsbf02.news.aol.com>
Source record: 218588

Has anyone here had any experience using the CAT-1000 Repeater Controller as a repeater, and a remote base??? I might buy a TS-440 just for that purpose.
Otherwise I wouldn't want the TS440. ;-) Quick replies would be greatly appreciated.

3001. Mod for Icom 737 and 737A-Expanded RF?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-19 00:00:00 UTC
From: haworth@Direct.CA
Message-ID: <3n46p7$oql@stud.Direct.CA>
Source record: 218589

As luck would have it, the Logic Board on the 737A does not have Diode D3
(or D4 or D5) as does the older 737...
Instead it has a Diode labelled D303 ..which when cut makes the set non-operational.
.(and nearly drove me to have a drink of hemlock before falling on my sword)

Given this has anybody tried to modify the 737A for expanded Rf ??

Any help would be appreciated.

Please email me at <haworth@DIRECT.CA>

73 and thanks

Paul:

Congratulations on getting your Tech+! Maybe we can meet on 40CW when you get your 440 working. I'ts unlikely that your father-in-law modified the rig. A few questions:

1. Can you get carrier on A.M. or tune mode? This verifies that your RF carrier components are ok.

2. Can you get a CW sidetone from your keyer when on CW?

3. If your rig has an antenna tuner, does it work? A small carrier must be output for it to work?

4. Have you tried all methods of keying; i.e. vox, push the manual key button on your rig (I think it's called send), etc.?

5. Have you tried another code key, or tried re-wiring the one you've got?

If the answers to these questions are yes, yes, yes, yes and yes then I'm out of ideas.

Good luck. You can email me at nitz@access.digex.net for more questions...I suspect you may have already got it working.

>ok. (Cushcraft, Butternut, GAP, or ???).

I've used two different Butternuts (the HF2V for 80 and 40) and
the HF6V. Both worked very well and I was happy with them.
I did take the time and trouble to lay out a decent radial
system under them (30 radials of varying lengths). I haven't
heard yet how the new GAP is. I do have a GAP Voyager DX-IV
(the 45-ft tall 160-20m vertical) which I recommend very very
highly for those who want to chase DX on 80 and 40. It's a
bit of a hassle to put up, and it needs to be guyed more
strictly than GAP recommends, but the effort is well worth it.
More to the point, the Butternut 80-10 vertical will do a
creditable job as long as you put a decent radial system under it.

3017. RFD: rec.radio.amateur.low-profile

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-20 00:00:00 UTC
From: adam@libertynet.org
Message-ID: <3n6bvc$mc9@rodan.UU.NET>
Source record: 218500
Cross-posted to: news.announce.newgroups,news.groups,rec.radio.amateur.antenna,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.space,rec.radio.amateur.policy

REQUEST FOR DISCUSSION (RFD)
unmoderated group rec.radio.amateur.low-profile

Group Name: rec.radio.amateur.low-profile
Proponent: Adam O'Donnell <adam@libertynet.org>
Distribution: worldwide
Newsgroups file: Operation of low-profile amateur radio stations.

This is a formal Request For Discussion on the creation of an unmoderated Usenet newsgroup, rec.radio.amateur.low-profile.

This RFD has been posted in accordance with the Guidelines for Newsgroup Creation. Its language is based on previously submitted RFDs.

****

NOTE: This is not a Call for Votes (CFV). Do not try to vote now.

This message begins a discussion period considering the creation of a rec.radio.amateur.low-profile newsgroup. Discussion should take place in news.groups. All follow-up posts should be made to news.groups.

Any comments such as "I vote yes for rec.radio.amateur.low-profile" will be treated only as a positive reaction to the proposed charter and not as a yes vote on the creation of the group. The CFV will contain instructions on how to vote.

****

CHARTER:

Rec.Radio.Amateur.Low-Profile is a newsgroup devoted to those amateurs who, for various reasons, must configure their radio stations to operate from restrictive areas such as condos, apartments, townhouses, neighborhoods with outdoor antenna restrictions, ships/boats, mobile homes,
or wherever they fry their burgers and call home.

The objective of this newsgroup is to encourage us to investigate means of employing all of the modes available to us for as many different purposes as possible. For examples, how can we use: FM (frequency modulation), CW (morse code),
SSB (Single Side Band: Voice on the Short Wave bands) on: LongWave, ShortWave, VHF (Very High Frequency), UHF (Ultra High Frequency), MicroWave, and Satellite.

Operators who use the newsgroup will be encouraged to describe in
detail their home station and how they solved the never-ending problem of
small city lots and housing development "no-antenna" contracts.

Rec.Radio.Amateur.Low-Profile will be an unmoderated newsgroup.
Users of the group are already experienced netiquette because of their
experience in Amateur Radio, which is a sort of Ladies/Gentleman's club.

A Rec.Radio.Amateur.Low-Profile FAQ will be posted a few weeks after the
creation of the newsgroup.

REASONING:

There are many newsgroups and mailing lists that exist on the
Internet for amateur radio antennas, low power operation, satellite
communications, etc. where operators in restrictive conditions post
continually post messages for help with their situation. In more cases
than not, the operator cannot find sufficient help on the 'group or list.

There should be a place where people who have solved their problems
with cramped quarters can post their problems to a group of knowledgable
amateurs.

I have conducted several informal polls and have discovered
that there are many amateurs (and, actually, non-amateurs) who would
very much favor and enjoy the creation of a newsgroup of this sort.

Distribution of RFD:

The complete official messages - RFD, CFV and vote results
will be posted to these required or affected newsgroups:
news.announce.newgroups, news.groups
rec.radio.amateur.antenna, rec.radio.amateur.misc,
rec.radio.amateur.homebrew, rec.radio.amateur.equiptment,
rec.radio.amateur.space, rec.radio.amateur.policy

Procedure for creating this newsgroup:

Interested parties are encouraged to comment on this proposal in
news.groups. Please post your comments *only* in news.groups.

After 21 days, if there appears to be a strong consensus in favor of
this proposal as it is written here, a CFV will be posted, which
will initiate the voting process; otherwise, discussion will
continue until a more refined proposal can be prepared.

After the CFV is posted, the voting period will be at least 21 days.
If the group passes by receiving 100 more YES votes than NO votes,
and (at least) two-thirds of the total vote is affirmative, the
newsgroup
rec.radio.amateur.low-profile will be created.

Again, please do *not* vote now. The voting process has not begun,
and your votes will be DISCARDED if you attempt to do so.

For more information on the newsgroup creation process, see the
documents entitled "How to Create a New Usenet Newsgroup" and
"Usenet Newsgroup Creation Companion", posted regularly to news.groups,
news.announce.newusers, and news.answers, and available for ftp at
rtfm.mit.edu in /pub/usenet/news.groups.

72, 73 (best regards)
Adam O'Donnell <adam@libertynet.org>

3019. HF Transceiver Icom 736 or JRC JST-245?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-20 00:00:00 UTC
From: js024b@uhura.cc.rochester.edu
Message-ID: <1995Apr20.171614.17679@galileo.cc.rochester.edu>
Source record: 218502

I just passed my Extra exam on Tuesday and I am beginning to look into
getting my first HF radio (I passed my General and Advanced the previous
Saturday). I am looking into the Icom 736 and the JRC JST-245. They both
of similar features, but the JRC costs about $700 more. I read the review
of the 736 in QST, but I don't know anything about the JRC except from
their ads. Does anybody have any experience with either radio, and is the JRC
really worth the extra money?

Thanks.

It is hard to talk about this without being misunderstood.
There is such a thing as memory efect, but it is rarely, if ever, the reason you and I experience problems with our Nicads. Manufacturers, vendors, salesmen, all help to spread and strengthen this memory effect hysteria. Without intelligent chargers, Nicads are not user friendly. Most manufacturers that make chargers would rather build a cheap charger and have you believe your batteries died an early death because of the memory effect than to realize that it was the charger that ruined them. Vendors and salesmen just don't know any better. Take a look at all these products that you can by to "refresh" or dishcharge your batteries to avoid this memory effect! It is hard to convince people that the memory effect is not what is responsible for killing their batteries. The reason these new "refresh" chargers seem to work better is that since they drain your battery first, you avoid the real killer of batteries: overcharging.

>>love mine. 73's
>>

Another undocumented feature in earlier manuals is that you can scan both standard and priority memories simultaneously. To do this, select any standard memory and press/hold down either * (vSC) or # (^SC) to begin scanning. Now press F+B (PR/P-SC). This wasn't documented in the manual for the unit I purchased two years ago.

>friends about your tight front-end, just remember that the cost of this
>important function, is the lask of ability to kerchunk your local police
>department's repeater. Why complain anyway?

This is not entirely true, Mario. The Yaesu FT-2400 mobile rig receives from 140 to 174 MHz and transmits from 140 to 150 MHz out of the box. The specifications for the receiver section are identical to that of the HTX-202. I venture that it has little to do with the narrow bandpass of the receiver. The real answer is the fact that both the HTX-202 and the FT-2400 have very well designed receivers that are very selective.

Just my two cents worth.

: while the battery is in the radio? There is not a AC jack on the radio
: so I was wondering if there is some sort of regulation built in so I
: could use the charger as the AC adapter.

Assuming you mean the wall charger, I'm sure you can, but there are two problems:

1) Hum - if the battery is low (which is why you have it on the charger in the first place, presumably) you could transmit 60 cycle hum along with your voice. Of course, maybe you don't plan to transmit this way...

2) The AC wall charger only provides 60 ma. Barely enough to keep the battery from discharging while the squelch is open. Definitely not enough to power the radio while transmitting.

If all you intend to do is minimally charge the battery while listening to the radio on as conversations come and go, there's no problem, except that you won't really be able to tell if/when the battery becomes fully charged. If you really want the radio to be fully usable, you need to plug the charger base in to a regulated (also current limited) DC source that's set to the nominal battery voltage. You could also try the W&W battery eliminator with the cigarette lighter plug, definitely a better solution but you'll still need a power supply, or a big external battery...

Keywords:
Cc:

I wonder if anyone has come up with some viable options to Yaesu's $90.00 PA-10 for running an FT-11R from an external DC source. The one shortcoming of this HT seems to be that there is no simple way to run it with non-battery power. My idea is to buy the alkaline battery pack, mount a 9-volt voltage regulator inside the pack, and add a plug for connecting the pack to external DC. Does anyone who has played around with this problem have any other solutions?

tnx es 73 - John, W3GOI

From: pruth@ocvaxa.cc.oberlin.edu
Message-ID: <3n6bkd$1li@news.cc.oberlin.edu>
Source record: 218509

I have come into an FT757GX which is being serviced for a severely desensed receiver probably caused by the built-in keyer being on the fritz, being "ON" all the time, which also makes CW impossible, naturally. Aside from that problem, the original owner put a bug in my ear about how he thought the 757GX's receiver wasn't up to his standards, that, although most hams wouldn't notice any lack in receive, he, being a discriminating DXer, does notice. Are there any FT757GX owners out there who can tell me from experience how the receive of this rig measures up compared to other rigs, and if anyone has had similar problems with the internal keyer going bonkers? Thanks. 73 de Bill KB8USZ pruth@ocvaxa.cc.oberlin.edu (e-mail works better for me when responding)

3028. MFJ-941B Antenna Tuner Repair

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-20 00:00:00 UTC
From: gregl@iglou.com
Message-ID: <D7Cry9.MxI@iglou.com>
Source record: 218511

I have been loaned an MFJ-941B antenna tuner in which the inductance switch had been damaged and replaced by an alligator clip. All of the wires previously going from the switch to the inductor have been removed. I want to replace the switch and rewire it to its original state, but I don't know which conductors on the switch go to which taps on the inductor. I'd appreciate it if someone can give a run-down of the general wiring from the switch to the inductor taps, and also (just to make sure I have it right) where the center-tap of the switch goes.

The tuner works fine otherwise.

Also does anyone know which rating switch I should use and a source for it? Radio Shack stocks a 12-position switch of the right type, but I suspect its rating (something like 120V, .38 amps) isn't sufficient.

Most of your apparent selectivity will come from the filter
at 455kHz (actually it's the 3rd IF in the 765 when in CW mode,
because it's quadruple conversion). Definitely buy both. You
can flip the filter ON-OFF switches when you have the bottom
cover off, and hear it for yourself.

>>ok. (Cushcraft, Butternut, GAP, or ???).

I've used a Hy-Gain DX-88 for several years and I like it. I've
worked about 150 countries just on 40m with it. It's fairly
narrowband on 80m, but you can resonate it anyplace in the band
by adjusting the piston caps (at ground level, no climbing). I had
the 160m add-on kit installed for a while, but it was really too
short of an antenna for DX work on 160.

I've been riding and hamming for about 30 years each, and I've never been comfortable combining the two. I've installed radios on my bikes before, but found them to be such a big distraction that I took them off again. For me, safe riding is a full time job, and schmoozing on the radio just takes up too much of my attention. The thought of trying to make an autopatch on the bike gives me the cold shivers. I carry my HT in a fairing pocket, and when I want to talk, I pull over, put the bike on the kickstand, and then fiddle with the radio. While riding, I'm usually too busy dodging cars that swerve out of nowhere, and drivers who can't or won't see motorcycles.

Best of luck to you; just take care to ride first and talk second.

Hello all,,

Our club's technical committee is looking at replacing the controller on one of our 2m repeaters. It's been a while since we shopped them, and would like to hear from anyone who has any opinion on repeater controllers that they are using.

The minimum features that we need are voice ID, autopatch, DTMF control via phone line, and an auxiliary receiver input. How usable are things like voice mail, announcement capabilities, paging functions, schedulers, etc ??

I'd like to hear everyones opinions , good bad or ugly. Let me know the make & model if you have it.

regarding nicad batteries and charge memory.

everything I've read says that yes, it is possible, no, it is
not at all common, yes,it is very hard and difficult to do.
no, don't worry about it 'cause it is very, very unlikly that
you will duplicate the necessary conditions.

best way to guard against this rarely seen beastie is, it seems,
to charge your battery on a random discharge schedule, that is,
don't charge it at the same discharge condition more than 20 times
in a row!

>
> Ron - W8GMH
>

Well, I believe a Bird 43 is rated for 5% full-scale accuracy. That would mean for the 2500 watt slug +-125 watts (ie: 1000W could read as low as 875W or as high as 1125W).

Now combine that with the 1000W slug's 5% accuracy (+- 50W), and the total would be +- 175W worst case.

Example of your worst case: 1000H reads 1000W, but actual could be as low as 950W. 2500H slug is low, so 950W could read as low as 825W.

Now add in some measurement and technique variability, and I think your results are within tolerance.

Source record: 218531

Hi Tony-

Concerning Chris's question about the viability of using a Drake R8 as part of a two way rig...

I have used my R8 in two-way service, linked with an Icom IC-725 transceiver. It worked like a champ. The Icom has no provision for use with an external receiver, so I had to use an external antenna change over relay, but the combination did work just fine.

One excellent choice for a transmitter to use with the R8 would be the Drake T-4XC. It has an internal antenna change over relay, and if a linear amplifier is not being used, the VOX RELAY contacts that would normally be used for controlling the amp could be used directly to control the muting on the R8 I believe.

The combination would only operate in "separate" mode as far as frequency control, though. The R8 would not "transceive" with a transmitter like the old R-4C/T-4XC combination would. Of course, that's the way I use my Drake C Line anyhow. I agree with you, Tony.....I say Go for it!

Hi,

I have a Kenwood TH77A dual band(144/440) HT that
has been getting very little use lately. I'm
thinking about selling it, but I can't say that
it's forsale yet. I'd like to know: what is a
reasonable price for this radio?

I bought the radio new from AES a few years ago.
Features:

144/440
Duplex mode
CTCSS
DTSS
DTMF Memory (up to 15 digits per entry)
Paging Group functions
Battery w/15hr charger (PB-6 7.2V 600mAh) 2.5W on high
Up to 5W at 13.8V
Backlit Display and keypad
Manual and original box (if that's important to you)

I also have a mod sheet from Kenwood for receiving down to 118MHz
and in the 800MHz band. I have not made the modification.

Your suggestions would be appreciated.

Thanks,
Dave McKienzie - KD4MEB

Dale A. Hagert NM0H
3881 Serpentine Circle
Eagan, MN 55122
612-688-7155
email daleh@skypoint.com

I am in need of a copy of the schematic for a Hallicrafters SX-140.
Better yet would also be a copy of the manual. Naturally, I will
pay the cost of copying and shipping.
Thanks

3060. TRX for OSCAR

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-21 00:00:00 UTC
From: JUERGEN@prodata.de
Message-ID: <JUERGEN.111.00167631@prodata.de>
Source record: 218456

Hello!

We are looking for a TRX for our club station to do satellite QSOs. We heard some OMs here preferring Kenwood (2m/70cm) or YAESU 736.

Which one would you prefer? Advantages/Disadvatages?

Tnx,
Juergen - DG7SFC

3061. Re: FT-11R - external DC source

Newsgroup: rec.radio.amateur.equipment

From: HVML86A@prodigy.com
Message-ID: <3n9a47$2u1o@usenetp1.news.prodigy.com>
Source record: 218457

W & W Associates offer a battery pack case that contains a switching regulator. There is a coiled cord that attaches the case to a car lighter plug. The adaptor sells for about $40. It seems nice, but I dont't like the wire comming out of the front od the battery case. W & W number is 800.221.0732

I thought about making my own adaptor out of a dry cell case, but a regulator that could supply enought current would not easily fit in the case.

73, Tom KA3GYI

3062. Need manual for Kenwood TS-60S

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-21 00:00:00 UTC
From: f35lop@dsyibm.desy.de
Message-ID: <f35lop-2104951027130001@h1tof1.desy.de>
Source record: 218458

I recently bought a used Kenwood TS-60S compact 6-meter allmode through
the net. Unfortunately this came without the manual and I really need one
one in order to be able to exploit all of the bells and whistles. If
anyone could help me out with a mailed of FAXed xerox of a manual I'd be
very grateful. The price Kenwood asks for a replacement manual here in
Germany is just unbelievable !!
many thanks,
gerry - f35lop@dsyibm.desy.de - DD5AX

>light be easily replace, or is it a more technical job? Appreciate any
>comments. Thanks much.
>...Robert
>
Hi Robert,
"Been there, done that!"

I cut the leads to the lamp, flush with the lamp. Pulled out the bad lamp
case from the rubber shock mount. Pressed in an new lamp (with a screw
base) and soldered on the leads. I now have a backlit meter again.

P.S> I owe a TS-440 schematic and board print to... someone.
I foolishly erased where I was to send the prints,
(I'm an OF, ham for 38 years...)
If this is you, kindly send me your address.

Tom

3068. HTX-202 Mods?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-21 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.13056.7583.0NFBA089@woodybbs.com>
Source record: 218464

Subject: HTX-202 Mods?

There are NO frequency expansion mods for the HTX-202.

The unit performs marvelously - and exactly as advertised.

There was a "mod" floating around - but it is NOT legitimate, and will
only kill your HT.

• wcECHO 4.0 • AR-Net: ATTENTION to Details • Mira Loma, CA • 909-681-6221

3069. What is HTX202 "Er2" code

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-21 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.13057.7583.0NFBA08A@woodybbs.com>
Source record: 218465

Subject: What is HTX202 "Er2" code

>>My HTX-202 HT went on the blink this morning. Started blinking
>>"Er2" and beeping. I checked the internal battery and its 3.0v.
>>I tried the F-CLR power up to clear out the ram, but no help.

HTX-202 Error Codes (taken from a Radio Shack memo)

ER1 indicates an internal RAM error. It appears when the memory backup battery is dead, when something has caused the memory contents to become corrupt, or as a result of physical or static electric shock. To clear this error, turn off the unit. Then turn it back on while holding down the "function" and "D" buttons. This clears the memory. If the error returns after you clear the memory, service is required.

ER2 indicates a PLL unlock. The radio gives this error if the PLL alignment is off or if the transmitted signal interferes with the internal PLL frequency. This error has been reported most frequently when using the supplied "rubber ducky" antenna with either a high-power battery pack or with an external DC source.

According to the memo, the fix for this is to use an external antenna when using external DC power. The memo goes on to say that if the problem persists, send the transciever to the repair center.

Hi ya'll;
The other day I posted to this group, looking for 220 repeater stuff and some other items. This was on the advice of a couple people who've been playing on the net for a while. From the response I got, this post was not appreciated, nor approptiate to this group. Normally I'd apologize for a mistake - but not this time.

I received loads of vile, caustic, obcene and in some cases biologically impossible opinions as to what I should have done or should do. At the mild end was some sarcasm, and one actual courteous and informative response. I will apologize to the person who was courteous and informative - but I lost your address. Oops.

All I can say to those who responded by Flaming, you have a lot to learn about Amateur Radio. This is supposed to be a friendly hobby. As the Control Operator for 3 wide area repeaters (including a sickly 220 machine!) I see mistakes by users as an opportunity to educate folks. So far this attitude has worked well.

So to the Professional Flamers out there: K-Mart sells just about everything. Run do not walk and get yourselves a life. They are likely to be on sale!

I have the following stuff to get rid of. If you do not like the prices
or if none are listed, make an offer.

(614)-442-8615 is my home phone number.
Andrew Pitonyak
N8QKR

PRO-43 scanner with extended receive enabled $260

Yaesu FT-470 hand held 2 meter and 70 cm ham $250
I have many extras to offer here...
Car amplifier for both bands, 35 watts
Head set, speaker mike,
external quick charger,
extra bateries, car adapter,
AA batery holder, Quantum HAM battery,
extra antennas
How about a deal on the whole thing...

ICOM-735 HF HAM radio. $650

ASTRON 20 AMP power supply ...$75

MFJ versa tuner II, MFH - 422B bench paddle,
straight key, Heathkit SWP and power meter (2 meters in one)
Heathkit field strngth meter

About 100 feet of used antenna cable, I don't want to throw it
away, I can throw it in if you purchase a radio.

Central Point PC copy board $15

AT IDE IO adapter $5

Just curious if anyone knows where one could find known mods for this scanner.

Specifically, extending the scanning frequencies into the 880-895 Mhz range as these are currently locked out in the US version of this unit (maybe in all versions of it for all I know).

Any help would be appreciated,

Wayne VE3WQS

Motorola....all you need is a switch and extra mounts for the xtals...no big deal....

GE MSTR II...chg the xtals in the elements and retune to 6...thats it..
you MAY have to change a resistor in a driver stage to get more gain out of it
IF you plan to TX on some widely spaced channels...

In addition to everyone elses comments, if you remove the specifications plate from the front of a Bird slug you will find a calibration pot (at least on their old slugs). While plenty rugged, these slugs can be prone to "recalibration-by-dropping". Maybe this info was best kept a secret!

Source record: 218467

Well, I'd double check the little 3 position slide on the top of the case (left side, forward). The slide should be in the middle or far right detent. I have a DSP filter sitting on top of my 440 and frequently bump this switch when I'm fooling around with that piece of equipment.

Since the 440 doesn't handle a bug or iambic key directly, you'll need a straight key. unless you are running through a data controller or a box of some sort.

Other than that, I can't imagine what the problem could be. The 440s are pretty straight forward. Nor can I imagine a mod that would disable the cw part of the rig.

Hi, I have the following for sale:

Swan Cygnet 270B Transceiver
- The radio works great, but it needs some tubes replaced to bring it back up to full output power.

Heathkit HM-2140 dual HF wattmeter

10-mtr. dipole antenna

Best offer gets it. I would rather like to sell the whole thing than rather piece it out. I would be interested in tradeing for a Commodore 128D or a Atari Jaguar. If you have any questions, feel free to e-mail me. Thanks for looking!

As a condo-dwelling ham, I can see a use for this group. It would be
handy to be able to exchange information about invisible antennas and
RFI/TVI type problems, etc., in a focused group. I couldn't say how many
people woudlpost to it, though. Anyone else interested?

Hi.

I have a Yaesu 107M HF tranceiver with a dead frquency counter.
The problem is the LSI chip responsible for counting and subsequently
displaying the current frequency.

The Yaesu Part No. is G1090249 the part itself is an MSM 9520 RS

It's a 40 pin wide DIL package located just under the two AA backup
batteries which in front of the speaker at top of the radio.

I have try the local agents in New Zealand but they claim Yaesu
no longer stock such a beast.

If anyone knows of a place I can obtain the chip from I would be
eternally greatful.

My EMAIL address is "bryanjr@iprolink.co.nz". (HAM Call is ZL1HIT)

Thank you in advance for any assistance you can render.

IN> I'm trying to find out what kind of radio system can be used to
IN>access the internet. Is anyone doing this? I live in a third world
IN>country and I'm trying to find alternative ways to provide internet
IN>services. Any information on RTTY is also appreciated. Thanks Sheila
Hello Sheila.....Some hams are beginning to access the Internet via
packet radio. This is posing some problems however. As I'm sure you're
aware, almost anything go's on the "net" .....however one must be very
careful about what is discussed over the airwaves. No profanity or that
type of thing is allowed. Therefore, finding someone who would be
willing to setup a "gateway" is tough. However, there are gateways
available, there is a terrific article in the January 1995 QST on
this....try to find a copy, let me know if you can't. Are you a ham?
Do you use packet? I am also an old RTTY enthusiast, I have 9 old rtty
machines, and I just love tinkering with them. Well, hope this helps,
where are you? I look forward to hearing from you.

To expand on this: if you use the ACC2 connector with a TNC, you will get RF feedback thru the TNC on SSB unless you apply a factory modification. In fact, I believe that this modification is the only technical bulletin out on the 850. I had this done by the factory, and it cured the problem. Otherwise, you must disconnect the ACC2 port from the TNC when operating sideband.

Worked for me.

The FT-736R remains the best for the money. It's a dated design, but
it does what you want to do in an adequate and straight forward manner.
The Kenwood offerings, TS-711, TS-811, and TS-790A, are, to put it mildly,
not well suited to satellite operations. Their performance is less than
sterling, and their user interfaces are baroque when used for satellite
operations. The Icom Twins, the IC-275H and IC-475H, are excellent. Except
for their rather substantial combined cost, I'd say they are the best way
to go. The Icom IC-970 is also adequate, though again costly. The IC-820H
is less than satisfactory for satellite due to ergonomic factors. Like
the Kenwood TS-790A, the designers of the IC-820H didn't *think* clearly
about what is needed to operate satellites well. The designers of the
FT-736R, on the other hand, apparently *did* think about satellite
operations since the radio is ideally configured for that use.

Shape factor will be the reason. The - 60 db point on the 455 KHz filter will be narrower then the same poine is on the 9 MHz filter. Think of pushing the received signal thru a funnel.
The bandwidth keeps getting smaller due to the funnel effect.

3096. Problems with RF & computer monitors?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-22 00:00:00 UTC
From: shade@primenet.com
Message-ID: <3nbj58$3b9@news.primenet.com>
Source record: 218479

Anyone ever experience problems between their handhelds and computer monitors?

I just received my Z1A Thursday and since using it the house, my monitor screen has proceeded to "twitch." The problem seems much more apparent when I use the HT on VHF and I can not marked change in the twitching (it gets significantly worse).

My monitor is a ViewSonic 6 and has an RF block, I do believe, where the video cable connects to my PC.

Even now that I have turned the HT off, removed it's antenna, and unplugged it from it's AC/DC adapter, the monitor still twitches.

Any ideas?

From: jackl@pinetree.microserve.com
Message-ID: <3nc0md$q64@nuclear.microserve.net>
Source record: 218483

My older Yaesu transceiver has a *very* effective RF speech processor,
but at some point in the not too distant future, I will need to replace the rig.

Looking through ads for new equipment, there's little mention of this feature.
Should I assume that RF processors are now so common that their presence
in the ads is passe', or have manufacturers switched to AF processors in order
to save costs?

73,

Jack WB3U

I use a Throat Mic that picks up the sound through your throat, thus
not picking up any road or wind noise. The sound is quite a bit
different and the people who know you will hardly recognize you but
unless you want to invest in a helmet with a built in mic this is
a good alternative. They are available from most ham dealers and cost
close to $100.

Good post and I'm having the same problem with my radio killing my
engine when I use high power, thanks for your suggestion and I'll be
trying that tomorrow!

> Telescopic antennas I've been looking at are the AEA Hot Rod and the ANLI
> AL-800. Does anyone have any recommendations/experience with other telescopic
> or flexible HT antennas? Thanks in advance.

I recently purchased an antenna from Comet, model CH-722Sa and I can't get over how well it works. It is almost 3 feet long and is pretty unpractical for HT use unless you plan on being stationary. It does not telescope but does break down into two 18" sections. The antenna has a base loading coil and a center coil also.

I use mine with a window mount BNC connector that is attached to my motorcycle windshield so I don't really care about it being impracticle for standard HT use. I also use the antenna for portable packet use with my laptop for greater range.

I have compared it to the AEA Hot Rod, Diamonds 18" rubber duckie and Larsens's 12" rubber duckie and it by far works better (about twice as good). Oh ya I forgot to mention the Comet I mention is a dual-band antenna with about 3 db gain on 2 meters.

I bought this antenna mainly for motorcycle use but when I found out how good it works I started carrying it around in my car above the visor and use it when I need to for distance and packet. The catch here is the antenna costed over $50 with shipping! But since it works as well as it does I'm not dissappointed.

>
> Ron - W8GMH
>

Well, I believe a Bird 43 is rated for 5% full-scale accuracy. That
would mean for the 2500 watt slug +-125 watts (ie: 1000W could read
as low as 875W or as high as 1125W).

Now combine that with the 1000W slug's 5% accuracy (+- 50W), and the total would be +- 175W worst case.

Example of your worst case: 1000H reads 1000W, but actual could be as low as 950W. 2500H slug is low, so 950W could read as low as 825W.

Now add in some measurement and technique variability, and I think your results are within tolerance.

Sorry Mike,
There are NO mods for the HTX-202. Tandy got burned on the HTX-100
so one of the stipulations for allowing MAXON to manufacture this rig
(under license from ICOM) was that there be NO modifications possible.

From: sgorecki@feldspar.com (Steve Gorecki)
Subject: ICOM IC-736 DDS/VCO Bug/Fix

I have just received confirmation from ICOM Canada that there is a bug
in the design of the IC-736 with respect to frequency generation. It
seems that although it seems to be a common problem, not all IC-736's
exhibit the problem. It seems that there is a "floating" data/address
line and at times it floats the wrong direction, giving about 30HZ
(maybe 32HZ?) difference in LSB mode. The fix is to solder a 47K
resistor between pins 17 and 10 on IC24 on the main board. (bottom of
radio, near front). I have not yet tried the fix, as I just got it
today.
To see if you too have the problem, try the following test:

1) switch to AM first and tune to a strong AM carrier, and switch to
LSB (once and only once) 40M is a good place to try this.
2) tune the carrier to about 400HZ tone and listen carefully.
3) switch to USB and back to LSB quickly. You should hear a different
tone. If not, then you are "floating" in the right direction.
4) switching to USB and back to LSB will not produce any more
differences. You must LEAVE SSB mode (ie AM) and come back to LSB for

the first time to re-set the "floating" line. It is the LSB/USB/LSB
switch that shows the difference in the two LSB received frequencies
(by tone only, the display does not change...)

I've tried to post this message about 4 times so far with no apparent
success. Hopefully this one will make it....73's and hope that helps
someone

From: adam@libertynet.org (Adam O'Donnell)
Subject: RFD: rec.radio.amateur.low-profile

REQUEST FOR DISCUSSION (RFD)
unmoderated group rec.radio.amateur.low-profile

Group Name: rec.radio.amateur.low-profile
Proponent: Adam O'Donnell <adam@libertynet.org>
Distribution: worldwide
Newsgroups file: Operation of low-profile amateur radio stations.

This is a formal Request For Discussion on the creation of an unmoderated
Usenet newsgroup, rec.radio.amateur.low-profile.

This RFD has been posted in accordance with the Guidelines for Newsgroup
Creation. Its language is based on previously submitted RFDs.

****

NOTE: This is not a Call for Votes (CFV). Do not try to vote now.

This message begins a discussion period considering the creation of a
rec.radio.amateur.low-profile newsgroup. Discussion should take place in
news.groups. All follow-up posts should be made to news.groups.

Any comments such as "I vote yes for rec.radio.amateur.low-profile" will
be treated only as a positive reaction to the proposed charter and not
as a yes vote on the creation of the group. The CFV will contain
instructions on how to vote.

****

CHARTER:

Rec.Radio.Amateur.Low-Profile is a newsgroup devoted to those
amateurs who, for various reasons, must configure their radio stations
to operate from restrictive areas such as condos, apartments, townhouses,
neighborhoods with outdoor antenna restrictions, ships/boats, mobile
homes,
or wherever they fry their burgers and call home.

The objective of this newsgroup is to encourage us to investigate
means of employing all of the modes available to us for as many different
purposes as possible. For examples, how can we use: FM (frequency
modulation), CW (morse code),

SSB (Single Side Band: Voice on the Short Wave bands) on: LongWave,
ShortWave, VHF (Very High Frequency), UHF (Ultra High Frequency),
MicroWave, and Satellite.

Operators who use the newsgroup will be encouraged to describe in
detail their home station and how they solved the never-ending problem of
small city lots and housing development "no-antenna" contracts.

Rec.Radio.Amateur.Low-Profile will be an unmoderated newsgroup.
Users of the group are already experienced netiquette because of their
experience in Amateur Radio, which is a sort of Ladies/Gentleman's club.

A Rec.Radio.Amateur.Low-Profile FAQ will be posted a few weeks after the
creation of the newsgroup.

REASONING:

There are many newsgroups and mailing lists that exist on the
Internet for amateur radio antennas, low power operation, satellite
communications, etc. where operators in restrictive conditions post
continually post messages for help with their situation. In more cases
than not, the operator cannot find sufficient help on the 'group or list.

There should be a place where people who have solved their problems
with cramped quarters can post their problems to a group of knowledgable
amateurs.

I have conducted several informal polls and have discovered
that there are many amateurs (and, actually, non-amateurs) who would
very much favor and enjoy the creation of a newsgroup of this sort.

Distribution of RFD:

The complete official messages - RFD, CFV and vote results
will be posted to these required or affected newsgroups:
news.announce.newgroups, news.groups
rec.radio.amateur.antenna, rec.radio.amateur.misc,
rec.radio.amateur.homebrew, rec.radio.amateur.equiptment,
rec.radio.amateur.space, rec.radio.amateur.policy

Procedure for creating this newsgroup:

Interested parties are encouraged to comment on this proposal in
news.groups. Please post your comments *only* in news.groups.

After 21 days, if there appears to be a strong consensus in favor of
this proposal as it is written here, a CFV will be posted, which
will initiate the voting process; otherwise, discussion will
continue until a more refined proposal can be prepared.

After the CFV is posted, the voting period will be at least 21 days.
If the group passes by receiving 100 more YES votes than NO votes,
and (at least) two-thirds of the total vote is affirmative, the
newsgroup

rec.radio.amateur.low-profile will be created.

Again, please do *not* vote now. The voting process has not begun,
and your votes will be DISCARDED if you attempt to do so.

For more information on the newsgroup creation process, see the
documents entitled "How to Create a New Usenet Newsgroup" and
"Usenet Newsgroup Creation Companion", posted regularly to news.groups,
news.announce.newusers, and news.answers, and available for ftp at
rtfm.mit.edu in /pub/usenet/news.groups.

: while the battery is in the radio? There is not a AC jack on the radio
: so I was wondering if there is some sort of regulation built in so I
: could use the charger as the AC adapter.

Assuming you mean the wall charger, I'm sure you can, but there are two problems:

1) Hum - if the battery is low (which is why you have it on the charger in the first place, presumably) you could transmit 60 cycle hum along with your voice. Of course, maybe you don't plan to transmit this way...

2) The AC wall charger only provides 60 ma. Barely enough to keep the battery from discharging while the squelch is open. Definitely not enough to power the radio while transmitting.

If all you intend to do is minimally charge the battery while listening to the radio on as conversations come and go, there's no problem, except that you won't really be able to tell if/when the battery becomes fully charged. If you really want the radio to be fully usable, you need to plug the charger base in to a regulated (also current limited) DC source that's set to the nominal battery voltage. You could also try the W&W battery eliminator with the cigarette lighter plug, definitely a better solution but you'll still need a power supply, or a big external battery...

From: pruth@ocvaxa.cc.oberlin.edu
Subject: Yaesu FT757GX receive problem?

I have come into an FT757GX which is being serviced for a severely desensed receiver probably caused by the built-in keyer being on the fritz, being "ON" all the time, which also makes CW impossible, naturally. Aside from that problem, the original owner put a bug in my ear about how he thought the 757GX's receiver wasn't up to his standards, that, although most hams wouldn't notice any lack in receive, he, being a discriminating DXer, does notice. Are there any FT757GX owners out there who can tell me from experience how the receive of this rig measures up compared to other rigs, and if anyone has had similar problems with the internal keyer going bonkers? Thanks. 73 de Bill KB8USZ pruth@ocvaxa.cc.oberlin.edu (e-mail works better for me when responding)

From: tschuld@gpu.srv.ualberta.ca
Message-ID: <3ne893$m0g@rover.ucs.ualberta.ca>
Source record: 218404

Hello,
I am currently working toward my license, and am trying to learn about some of the older radios; transmitters and transceivers. I have posted before asking about transmitters that I could operate alongside my Drake R8. Reactions have been mixed to this, and some suggest that I would be better off sticking with an older transceiver.
I have talked to at least two people that run newer recievers with older transceivers. One fellow runs a Yaesu 101 with a Kenwood R-5000. As far as the older transceivers are concerned, which were the better ones? Which would be more appropriate with my R8? As far as the older transmitters are concerned, which ones could I look for, and what should I be expecting to pay?
I have picked up the Ham mags, and see only the QRP CW transmitters, so I assume no one makes all mode transmitters any more. I have heard that Drake made some transmitters, and that the last solid state one (T7X?), wasn't up to much. The T4X however, I have heard fairly positive comments about. I will need something with 160 and 80 meters to start.
Any advice is appreciated.
Thanks,
Chris

>Thomas C. J. Sefranek WA1RHP

Thomas...
Thanks for your reply. I took the thing apart again, and it's not at
all clear to me where the lamp is! I couldn't get the plastic front
panel off because I couldn't figure out how to remove the tuning knob.
Don't know if that's critical. I don't have a service manual, so it's
hunt&peck using magnifying glasses [g]. Since you did it, i'm sure
it's possible. Please point me in the right direction for locating the
lite!! Thanks much.

I am currently writing a paper on the history and use of radio in the utility (gas, electricity, water) industry for an international conference. Whilst the paper is likely to have a UK bias, I would like to include details from further afield.

I would be interested to hear from anyone about either the early use of radio in their utility industrys (e.g. anyone using it before 1960?), how the use of radio has developed over the years, and any novel current uses. "Radio" is taken to include the full range, from mobile to fixed link, voice, data, telemetry etc. Details of particular radio types/systems used would be particularly useful.

Any amusing anecdotes related to the subject also gratefully received.

If you think that you may be able to help, please either follow-up post or e-mail me direct.

Thanks in advance,

David Burden

Of course you can! Use a TCP/IP gateway, then Telnet into
the server where you keep your mail. You can use pine to retrieve
and send messages. Have fun!

The problem is the voltage into the radio is past 12 volts. It unlocks
the PLL and destabilizes the oscillator.

Stop running it off your cigarette lighter without some kind of 12v
regulator. Your car's alternator is 13.8 volts. Tooooo much.

>What is the typical range for a 2m 50Watt mobile ?

Depends on terrain, type of antenna, and such, but I've heard mobiles about 50-70 miles away get into a repeater on a small mountain.

>Also, are there any mobile units that would work well as a base station ?

For my money, ANY mobile unit will work well as a base station. Unless you want to get into SSB, EME, or sattelites, I wouldn't spend the money that a dedicated VHF/UHF base station costs.

>Suggestions on antenna's for car or apartment ?

For car: If you plan on mostly just driving around town, a simple quarter-wave on a mag-mount will do just fine. But if you are going on trips and such where you'll be far away from repeaters, you may want to go with something like a 5/8 wave, and a sturdier mount to hold the larger antenna.

For apartment: I'm going to assume that you can't put up an outside antenna. If you can, great! There are many interesting stories behind putting up indoor and "secret" antennas. I've heard of everything from a mag-mount quarter-wave stuck on the refrigerator, to diploes strung up outside windows. For these situations, you have to look at what your options are, and then be creative. Things that seem really weird at first may actually work quite well (relatively).

3127. ICOM IC-765 PLL Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-23 00:00:00 UTC
From: n6itw@aimnet.com
Message-ID: <n6itw-2304951858250001@dial-bel1-1.iway.aimnet.com>
Source record: 218413

Has anyone ever had their ICOM 765 PLL board go out? If you did, how much did it cost to replace? My 5 year old 765 PLL board just died. I wonder how many of you out there have had the same problem. Craig Smith, N6ITW.

3128. th78a: problem with mods

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-23 00:00:00 UTC
From: daparish@biivax.dp.beckman.com
Message-ID: <1995Apr23.094527.1948@biivax.dp.beckman.com>
Source record: 218414

I've joined a local club that has a network of 440 repeaters around the LA
basin. The problem is that many of them require tx @ 430.xx which
my late model stock kenwood th78a wont do (comes with tx (approx)= 438 - 450.)

I've read through the 5 mod sheets for the 78 from one of the ftp sites, but
there are some conflicting comments in them. I was hoping someone familiar with
the mods could help.
this is what I got from the mod sheets:
late models (like the one I have) have 2 green jumper wires (w1,w2).
on both early and late models, diode d4 enables xband repeat.
3 other extensions are mentioned"
early model / late model
1) extended recv d6 or d5? / w2?
2) MARS/CAP d6 / w2
3) beyond mars/cap d5 / d3+w1 or just w1?

The MARS/CAP mods alone should give me the xmit range I need. Later I want to
do the full mod. I cut W1 but do not get the xmit freq I need.
On reviewing this I think I should have cut W2.
One of the mod sheets also mentions the need to reset cpu (F , 0) to enable the
mod?
Can anyone familiar with these mods shed some light?

The Alinco DJ-180 is an excellent 2m handheld transciever. I bought one about a year ago and have used it for packet and mobile use without any problems. I use it more for packet than anything else these days. Its also a rugged rig and built quite well. There is one mod for it that I am aware of. That is exteneded receive outside of the ham bands.

It's getting to the point that in order to live somewhere these days, it's necessary to waive all kinds of rights and otherwise regular privileges, including those pertaining to antennas that are normally at least partially protected by PRB-1. Condo and apartment living is becoming more common as single family dwellings are becoming less affordable and an increasing number of amateurs are being subjected to these severe restrictions.

The issues that might be addressed go beyond just a type of antenna. A rec.radio.amateur.low-profile newsgroup can deal with and provide help with both "stealth" antennas and the issues that make them necessary.

The RAMSEY packet modem, is simply that a modem, it is not a TNC...

The Baycom program takes the data received and converts it to a readable format performing the function of a TNC.

So a com program will not have these capabilities.

I need to know a frequency that can be used for a low power transmitter for "home" use, like a remote control or whatever, above 800 Mhz. I want to put out up to 300 mW, but would settle for 100 mW.

I really don't know where to look, so if you would please tell me where you got your data, it would be appreciated. I looked through my "scanner" listing and also the ARRL manual with no luck.

This is for use both in the USA and elsewhere, so it would be nice to have a freq that is open everywhere. (yea I know, good luck)

It needs to be "approved" by any local government, since it may become a product.

Please write me via Email, so as to not tie up the net, thanks!

>band antenna with about 3 db gain on 2 meters.

I don't doubt that it is much better than any *duck* but tell me how
you tested it against the AEA Hot Rod. What methods did you use to
determine that it has 3db gain over the AEA? What were your specific
results?

Thanks,

The "twitching" is the result of the RF interfering with sync decoding
in the monitor. This may be entering the monitor via pickup on the
video or power cabling to the monitor, or directly through the monitor's
plastic case. The usual steps should eliminate the problem. Use well
shielded cables, use ferrite cores on the cabling where it enters the
monitor, and shield the plastic case with a conductive spray or copper
screening. In addition, try to use an outside antenna to keep RF out of
the room.

Um, why do you call this a hidden function? It's right there in the manual. I've been looking at it with an eye towards a purchase and I've gone back and looked at the manual twice. I think the salesman knows I'm probably gonna purchase before the sale ends on the 28th. ;-)

It does look like a good beginner's rig and has what I seem to need for my intended use: packet, night use outdoors, scanning for finding any activity when driving along bored.

3153. Radio Shack 2 m amp. good?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-24 00:00:00 UTC
From: seront@seism1.ess.sunysb.edu
Message-ID: <3nggv1$51q@adam.cc.sunysb.edu>
Source record: 218355

I bought a radio shoack 2 m, 30 W amplifier a few days ago.
With between 3 and 4 watts from my HT I only obtained 15-16 watts
at the output of the amplifier.
I came back for an exchange and the guy said he had another one returned
for the same reason (and gave me a full refund, please do not start a flame against RS, and try to do
that with a mail company).
Any input from other users? Either the unit I had was defective, or the amp amplifies only 6 times (assuming my wattmeter is pessimistic), and you really need 5W in to have 30W out. I would expect 8 to 10 times amplification, as you see usually for such amps. Can someone test that
and give us some measurements.
Thanks
Bernard, KB2TGH

3154. Ideal 2m radio ???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-24 00:00:00 UTC
From: mead@tetonrtp.dg.com
Message-ID: <1995Apr24.200210.1717@dg-rtp.dg.com>
Source record: 218356

I have recently received my Technicians license and want to
purchase a radio. Any useful guidance will be much appreciated.
Here is some info that may help:
1. I already have an icom 2gxat/hp (2m)
2. Primary use of the radio would be mobil.
3. I may have to also use the unit as a base station to
keep costs down.
4. I am interested in packet radio.
5. I do a fair amount of traveling and camping.
6. I like most of the features of the icom, but would like to be able
to build more scan groups. For instance I'd like to be able to have
a scan group fro 2m repeater outputs to help find repeaters while
traveling. It would also be nice to give multiple ranges within a
scan group.
7. I originally thought that I wanted a dual band 2m/440 mobile with
cross band repeating. I could then get a second ht with 2m/440 to
use when hiking/camping that could be used to access the mobile rig.
However I have heard many complaints about 440 and am not sure that
dual banding is worth it.
8. Is it realistic to use the mobile as a base, or do most people get
get tired of carting it in and out?
9. Are there any radio mounts that are better than others?
10. There are no dealers near me to go check out. Nearest known dealer
is 2.5 hrs away.

I have the anli 800 and I love it. I even went out and bought another one
for my scanner. The extended center load antenna out performs the mag
mount (diamond) on my truck, and the flexible "ducky" antenna that
comes with it is far better than the standard duckys. More expensive
than the hot rods, but you are actually getting two antennas.

Source record: 218366

I have a 78a, late model, that I've done the beyon MARS mod on. I'm planning on un-doing the mod for one reason alone, it now puts an automatic offset on *any* 2m freq put into the rig. The repeater that I use most is 146.76 -, this now shows as 146.7625.

That is still close enough to be used, but I can no longer use the 146.62 - machine here, due to the offset and the narrow filters on the repeater. I don't remember the exact offset put on that freq, but it was around 146.605.

Basically, I don't reccomend doing the beyond MARS mod, unless you really need the extra coverage.

: >"NiCds: Memory myth"? It is written by Dean Manley KH6B and he reports
: >
: > Actually, I don't know who to believe at this point.

: For what it's worth, I use an electric razor with Nicads, and after a few
: months of daily usage (recharging continuously) it would diminish motor speed.
: After disposing of several razors with this same failure mode, I decided
: after reading the KH6B article that I would run the razor to nearly dead
: state, then recharge it for 24 hours. After doing this, the razor has
: essentially the same motor speed as it was new. Dean's article saved me $$.

: 73 Dave WB0GAZ dgf@netcom.com

Nicad batterys should always be charged fully prior to there use but
not overcharged.Failure to fully charge the battery prior to use will
cause the memory effect especialy if this often happens.Also
Nicads should be discharged to their minimum useable level (approxamately
1 v per cell) about once per month under normall usage conditions <a little
past the low battery warning>if you treat these batterys whith this type
of care they will typically last about 10 years, if you have purchased
high quality batterys.A good charger will have an itelligent charge circuit
that fast charges the batterys to exactly the right point and then tapers
the charge to a tiny tricle and will give you an indication of compleation
(typically a led indicator)at this point the batterys should be removed from
the charger.
The memory effect is caused by for instance charging the battery 2/3 of
the way
then using it, then charging again only 2/3 of the way if this occurs often
enough (2-5 times) after a while the battery will charge only 2/3 of its
original capacity at that point the battery is damaged. If the battery is
again only charged partialy the memory effect is worsened and the total charge
capicity is further reduced, eventialy the battery becomes useless.
Some of this comes from personal expierence (particulary from having seen
others ruin them) and from taking good care of them myself and from reading
the GE nicad battery book.A good fast charger and a good set or 2 of them
is well worth the money.If you can't afford a fast charger and you need to
use your radio on the go often a 2nd set is a must.
If you take care of them nicads will last almost a life time.
A good charger and a couple sets of high quality nicads may set you back $100
or more but it is sure cheaper than chucking them in the trash periodicaly

and pouluting the environment.

3174. HW-16 Query

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-24 00:00:00 UTC
From: kbarton@cwis.unomaha.edu
Message-ID: <3nf4m3$a7m@s-cwis.unomaha.edu>
Source record: 218376

I inherited a Heath HW-16 from my dad which I would like to use
on the air (the radio, not my dad). It came with an HG-10B VFO. Question
is: What is the exact meaning of the terms (STBY, OPR and SPOT) on the VFO?
Obviously STBY is standby, OPR is operate, and SPOT is I believe, some tuning
function, but I have no manuals, and don't know how to use this thing correc-
ly.
Thanks in advance. -73-

3175. Convert Cell phone to cordless use?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-24 00:00:00 UTC
From: ad366@lafn.org
Message-ID: <1995Apr24.054127.18087@lafn.org>
Source record: 218377

Forgive me if this is the wrong forum to ask the following question, and
if it is, please direct me to the correct one.

I am interested in converting a pair of cell phones to a base
station/mobile unit, similiar to a standard cordless available on the
market today. The obvious benefit would be greatly increased range.
Obviously, the modification would have to include a frequency change.
Anybody done this? Difficult? Comments welcome. Please email. Thanks.

As for one who has had to deal with using "hidden attennas" I feel this newsgroup would be highly useful. As for those who might not feel this way, dont knock it until you have had the :pleasure" of working Alaska or Hawaii using 30 ga magnet wire for your attenna. The contacts at times my be rough but just as rewarding as any contact that can be made using Full size attenna's.

From: shade@primenet.com
Message-ID: <3nfa54$ffk@news.primenet.com>
Source record: 218431

I seem to be experiencing RF twitching problems with my monitor now that I've operated my HT (an ICOM IC-Z1A) inside my house. I never experienced problems with my monitor prior to operating my HT in my house. And, as the HT is the only ham gear that I own, I am not certain what other RF sources could be in the house that might interfere with my monitor.

Where would RF interfere with my monitor screen? The video card? The video cable on the way to the monitor? The power cable? Inside the monitor? How could I eliminate, or drastically reduce, the effect that has occurred?

Thanks in advance,

Shade

Aninda DasGupta (add@philabs.philips.com) wrote:

: Is there a FAQ or recommended book, or any literature on packet radio?
Vast amounts! The best thing to do is to go to your local ham club; there you will find MANY people who will advise you. Many will disagree with each other, but I think it is still better than trying to do it by books!
: I am most interested in the protocols used, how it connects to the
: Internet, what API toolkits are available, how the nodes are
The connection to the 'net is illegal in many countries; I don't think it is in the USA, so there are some gateways, always voluntarily run. The owners of these gateways put out instructions on how to use them (from both sides) in this group from time to time - look out for them.
: connected, what wavelengths are used, what antennae are required, and
Most bands have a packet segment - VHF and above tends to be for local use, h. f. and satellites for longer distance (at lower speeds on h. f.).
Aerials: unless you are providing the network with a special link, and only in special circumstances then, a simple omnidirectional aerial should be used; a directional one will make you not hear signals from `behind' you, which will cause you to transmit packets at the same time as the station behind you, with the result that neither of you will be received properly by the station you are trying to address. (Packet uses shared frequencies.)
: who are the popular vendors of digital radio equipment. I have heard
I could try to say - Kantronics is one of the biggest - but your local club will be able to tell you the USA scene better than I can,
: of AMTOR (sp?). How does that tie in with things? I guess I am trying
AMTOR came before packet, and is still used, especially on the h. f. bands; it sounds like a bird chirping. I think it only uses capital letters. It can be used on direct links over some distance, I think.
: to understand the entire process (every detail) of how a message that
: I might send to a friend halfway around the world would get there and
: be retrieved by my friend. Once I understand the process, I want to
Well, the normal way is you would `connect' to your local BB, and when you get the prompt - very like using a 'phone BB - type something like SP (or S) G6JPG@GB7NNA.GBR.EU, to which the BB would respond `Enter subject', and then `enter message, ending with CTRL-Z or /EX on a line by itself'; once you have done this, the message would propagate round the world between BBs - in much the same way as it does on the internet, but taking hours (can be days to obscure bits) instead of seconds or minutes. When your friend logs into their BB, it would say something like `you have mail; type RN to read it'. The prompts and method of use vary slightly depending on what BB software the BB is using, but it is all something like that.

Of course, some amateurs use TCP/IP on the air (in fact the software used by many to do TCP/IP on 'phone lines was originally written for this, by KA9Q), in

which case it looks even more like the internet.

: buy equipment, get a license and start playing with the setup. As is

Well, there are roughly two ways of getting on the air with packet. Obviously
you need a transceiver for the band(s) on which you are licenced; for packet,
any old clunker will do - in this country, ex-private-mobile-radio sets, with
new crystals for the new frequencies and a bit of adjustment, are quite widely
used. To go with that you need either a TNC - terminal node controller - and a
dumb terminal (or computer running a terminal emulation prog.), or one of the
implementations that make the computer do most of what the TNC does, and a very
simple interface to the transceiver. (Such emulations are available for at
least the PC.) Each approach has its advantages; the PC-doing-TNC one is
almost certainly cheapest, while the TNC route allows more sophisticated things
to be done (and the performance may be a little better, especially on h. f.).
: probably evident from my questions, I am a complete novice at amateur
: radio. Any help will be greatly appreciated. Thanks!

I own an FT290mkII. It's a neat little radio. Comes with a clip on 25W amp, and
you can get a clip on battery pack to take it in the field. Operating on the
clip on pack you are limited to 2.5W. Have taken it on day hikes on the
Appalachian Trail.

Performance is OK. The reciever can get clobbered in the presence of strong
sigs, say during a contest if you're in a busy area. Some have posted here
that the modulation on SSB is "squeaky" but I've never heard it myself :)
Tuning and switching between modes can be a pain. Going from SSB to CW and
back forces you to go thru FM, which sets the VFO to a course tuning step.
Memory operation is wierd. You should try one first to see what I mean.

Overall, though, if you dont have a ton of money to spend and you want to
dabble in FM, weak sig, packet, and even a little sat, and be able to go
portable or mobile, you can't beat it.

From: ahusik@pluto.njcc.com
Message-ID: <3nhdtc$ec@earth.njcc.com>
Source record: 218442

I recently found out about a company called JABRA that offers earmount speaker/mics, like the ones the secret service wears. I sent email to the company and asked them if they could sell me a model to fit an HT (most likely a kenwood TH-79A). A nice fellow there told me he would contact the company and get the specs on the microphone input, then get back to me. I have yet to receive a reply, however, I will post the results of his efforts -- they may benefit others.
Has anyone experimented with a mic/speaker of this sort? The great thing about JABRA seems to be their low cost. Most of their models are under $100 and, well, they at least look good in the .gifs I've seen<g>(I can't attest to quality as I haven't seen it first hand). If anyone has any experience with this, or another, brand of mic/speakers, I'd appreciate the references/suggestions.
Thanks, and good luck,

Adam Husik

I can vouch for this myself. Last year I purchased a HTX-202
at the Shack. Even came with all the local repeater frequencies
programmed in. The display was defective and the tuning dial on top
did not always work. This unit had a very low serial number, dispite
the fact that the HTX-202 had been on the market for a least a couple
of years. Of course I returned it and got a new unit (from another
store). Have had no problems with it, its intermod performance
runs ringa arounf my FT-470, so I am happy.

Also a couple of years ago I brought a "new" portable radio at
the Shack. The previous owmer had written in the user's manual
that came with it.

The HTX-202 is a good rig, I just wish that the Shack would not pawn
off defedtive used goods as new.....

My HTX-202 manual says the input extenal input voltage is 7.2 - 13.8 V
so why not run it off the car battery.
I have been doing so for several months. I also run it off an Astron Power
supply at 13.8 V. Are teh specs. invalid or is this not the problem?

From: Larry Shirley <larry@twi.timeinc.com>
Message-ID: <3njeqa$1bt@alterdial.UU.NET>
Source record: 218251

Due to unforeseen circumstances, my associate had to cancel his plans to attend the Hamvention this year and asked me to sell his ticket. Normally, one can only get a vendor's fleamarket ticket when lucky enough to get a fleamarket space. The big advantage is getting into the outdoor fleamarket area BEFORE the general public. This ticket gets you in on thursday when the vendors are setting up (and every following day) before the general public is admitted.

I will be leaving the NY-Metro area early wednesday morning with a Dayton ETA of about 8pm. To contact me please call my home phone this evening [7-11pm EST] (516) 673-7662 or beep me anytime thereafter at 1-800-490-3115. I will only return local calls in the Dayton area. The ticket will be brought to Dayton and will be available for pickup wednesday evening. No email replies please.

3201. Dual-band mobile recommendations

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-25 00:00:00 UTC
From: mconner@rain.atms.purdue.edu
Message-ID: <3njg6l$f64@mozo.cc.purdue.edu>

I expect to be buying a dual-band mobile unit for my car in the next few months. I've been looking at the Alinco DR-600T because of the remote control capability. I'll be working inside a building where it will be nearly impossible to access 2m repeaters with an HT, so I'd like to be able to do it via my car parked outside. I also need a radio that has a detachable face because it will be nearly impossible to mount the whole unit where I can get to it while driving. Other units I've been looking at (even if they don't have remote control):

Standard dual-band (one with everything in the mike)
Yaesu FT-5100/5200 (the one with detachable face)
Yaesu FT-8500 (when it comes out)

I'd like to hear about good/bad experiences with these units, especially the Alinco. I'd also like to know if there are any other units that are DTMF-controllable via an HT.

>

Why do ham retailers charge you a restocking fee in some cases if you return a product? Because they can no longer sell in in good conscience as new. This is a great way of doing business. In cases where the product had a problem, they usually do not charge the restocking fee.

What does RS do if you return a poorly performing product? They polish it up and repack it and sell it as new. Some poor unsuspecting buyer goes in and buys something that someone else has already used and mayber had trouble with. Most of the time they do not know the difference. It is a rip off.

All the RS employees out there can say otherwise, but we did it when I worked there and it still goes on today. Last year I went to an RS and bought a SW preamp. When I got home and opened the box, the unit was not wrapped in the usual plastic and had some other brand batteries in the unit. Someone returned it and they tried to pass along a used unit as new.

Not exactly. You can change the offset after the mod.
f(1sec) 3 - then the tuning knob will select tuning step.

A friend and myself both have done the 'beyond mars' mod
both work great! His is an older model and mine a newer one.

The only problem I have is the 800Mhz band is blocked on mine.
It shows on the display, you hear static, but no signals.
I heard of a 'cap mod' that was done to comply with the scanner law.
I feel that because I bought my radio BEFORE april 94, I should
legaly be able to fix this problem. I want to listen to the
public service bands and 900Mhz amateur bands.

* Anyone have info on this mod?

Thanks!

Glenn

Like I said before - thanks for the observation!

Think of all the wireless LAN systems now going in at 900Mhz...
You can tap into all kinds of fun stuff!
(but I wouldn't do THAT)

It's sad when we have to use security encyrption for amateur radio.

IMHO

3206. IC-281H information and question..

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-25 00:00:00 UTC
From: WALLY@ukcc.uky.edu
Message-ID: <1738B4CBS86.WALLY@ukcc.uky.edu>
Source record: 218257

I found today that pushing Band Set/Lock turns on crossband repeat...
Set the 2 metre frequency you want to transmit on (if it's into a
repeater put the input in the VFO, it won't switch itself if you
just have it in a memory channel for normal use) and then set the
440 frequency you want it to listen to, and then band and set/lock
for a second and the L indicator starts flashing, and you're set..

Unfortunately, I can't figure out how to get it to stop dead keying
due to erranous noises.. I had it set in my car at work with my
HT inside and I kept hearing clickclickclick every now and then
and thought it was one of the local idiots... Then I figured out
that it was prolly my radio and checked out out, and sure enough
it was going blipblipblip on the LCD.. This is with the squelch
all the way up..

If there ANY way to make it descriminatory to which signal it responds
to? If I set it to pager mode it unsets it when going into crossband,
it doesn't have tone decode (and apparently there is no way to get it
from what I can tell?) so I can't get it to ignore erraneous stuff..

Anyone have any ideas? It has the tone board in it, but it's
encode only... Decode allows it to ignore signals that aren't transmitting
the proper PL tone..

I'd appreciate ANY information on this, or any other stuff on the 281.
Thanks!

Let me relate my story. I just bought the HTX-202 about a week ago. After three days I started getting the dreaded "er2" errors. Since there's a Radio shack on every corner, I simply swapped it out for a new HT. Upon receiving the email about running the radio off of the 13.8v power supply, I called Radio Shack Tech Support (1-800-843-7422). They could not confirm the release of an official service bulletin documenting the problem, but I was told to NOT run the radio from the cigarette lighter while using the rubber duck antenna.

I would appreciate any other information on this problem.

I must admit there are several options in the field nowadays...
I would suggest either the CAT 300 (for about 300 bucks!) Which has patch,
voice ID, clock, control via phone line, etc....as for announcements, I find
them somewhat useless.....for some groups they are ok...for others, a waste!

LinkCom's RLC4 is also a good one to look at though it doesnt have VOICE...

From: shade@primenet.com (Shade)
Subject: How to eliminate RF interference in the home?

I seem to be experiencing RF twitching problems with my monitor now that I've operated my HT (an ICOM IC-Z1A) inside my house. I never experienced problems with my monitor prior to operating my HT in my house. And, as the HT is the only ham gear that I own, I am not certain what other RF sources could be in the house that might interfere with my monitor.

Where would RF interfere with my monitor screen? The video card? The video cable on the way to the monitor? The power cable? Inside the monitor? How could I eliminate, or drastically reduce, the effect that has occurred?

Thanks in advance,

Shade

Well, I saw one post that told you "of course you can", etc. Keep in
mind that some of your email may not be appropriate for amateur radio.
Also, that all your neighbors can see it when it flies by their
screens. What will you do to keep your account free of people
bootlegging your userid/password once you send it a couple of times
and the whole area knows what it is?

From: David@innocom.demon.co.uk (David Burden)
Subject: Radio in the Utility Industry

I am currently writing a paper on the history and use of radio in the
utility (gas, electricity, water) industry for an international
conference. Whilst the paper is likely to have a UK bias, I would like
to include details from further afield.

I would be interested to hear from anyone about either the early use of
radio in their utility industrys (e.g. anyone using it before 1960?),
how the use of radio has developed over the years, and any novel
current uses. "Radio" is taken to include the full range, from mobile
to fixed link, voice, data, telemetry etc. Details of particular radio
types/systems used would be particularly useful.

Any amusing anecdotes related to the subject also gratefully received.

If you think that you may be able to help, please either follow-up post
or e-mail me direct.

Thanks in advance,

David Burden
Telecommunications Consultant

>band antenna with about 3 db gain on 2 meters.

I don't doubt that it is much better than any *duck* but tell me how
you tested it against the AEA Hot Rod. What methods did you use to
determine that it has 3db gain over the AEA? What were your specific
results?

Thanks,

WHOA! Don't pull the front panel! Just remove the two screws that
hold the vox switch at the top-left of the front panel. The bulb is
right behind the s-meter, immediatly below the switch. Full
replacement access is right there.

>at the output of the amplifier.

What was the SWR? When I first hooked mine up, it refused to output much power because I had a bad PL259 connector. Anyway, assuming you have a solidly constructed antenna and feedline, you should get more power than that. I get about 20 watts out of mine with one watt input. I get about 30 with my HT on high power. This is all with 12v. If I start the car, I get about 25/40 watts with the same scenario. When I use my HTX-202 doing about 10 watts into the amp, I get close to 50 watts out.

I presently use PC PakRatt for Windows Version 2.0.
I think it's great. Comes with a logging program.
I use it for VHF packet, RTTY, AMTOR and Pactor.
It has a pretty good help menu also. You can really
customize it for your needs. (ie I have a ton of macro
functions)

I upgraded from the PC PakRAtt for DOS. That's ok if you
don't have Windows.

SMART CARD READER / PROGRAMMER
PIC 16C84 PROGRAMMER

An extremly versatile unit to enable the user to Read and Write to all types of ISO 7816 Smart cards AND Program PIC16C84 devices.

The unit requires an IBM PC computer and a power supply of between 15 and 20 Volts AC or DC.

Fully ISO 7816 compatible (the standard used in many TV access cards, Phone cards and GSM Mobile Phones)

The Smart Card ISO7816 Reader / Programmer software can use external data files to write to the card and "log" the answers back to a disk file of your choice. Data parameters can be changed from within the software. Single or Multiple bytes can be sent via the on screen "Send Buffer" editor, any response from the card will be displayed in the "Received File" Window.

The PIC84 programmer will allow the user to program the chips in circuit via a 5 pin connector on the main board, the unit can also program the common 2Chip and 3Chip ISO7816 card emulators commonly used in the Satellite TV industry.
With this unit it is possible to program in .BIN or .OBJ format

The unit is supplied with powerful operating software to enable the user to Read / Write / Copy and Examine / Change any or all of the internal memory on the 2 and 3 Chip ISO7816 type smartcard emulators.

The unit mesures 9cm X 6.5cm approx, is double sided throgh plated and solder masked, because of the high standard of manufacture we have no problem in offering a 1 Year parts and labour guarantee with every unit.

The unit is supplied with all operating software and "useful" data on various subjects relating to Smart Cards.

The complete package (hardware / software and data) costs only:-
79.95 inclusive of postage and packing to UK
85.00 inclusive of postage and packing to EEC (outside UK)
other destinations 85.00 + DHL costs or Royal Mail swift costs.

Cheques or Money Orders to:

> for a hand held radio. I have the TH79a and I am very pleased with it. As
> far as the 5 Watts, the radio would always put out 5W with at least 9V. If
> you have any more questions let me know via e-mail at mallorys@nbnet.nb.ca

Thanks a lot for your reply, I appreciate it. The TH79 really seems
appealing, however, I want to make sure there aren't others I should be
considering as well. The only other similar options seem to be the Yaesu
FT-51R and the new icom IC-Z1A (with the removable control piece). They
are all the same price, give or take a few dollars, so it makes the
decision very hard. In addition, there aren't any ham stores in my area
so I can't really try them out first.
Any suggestions? Thanks again,

Adam

3224. S-38 BFO

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-25 00:00:00 UTC
From: cowart@convex.com
Message-ID: <3njg18$qpr@neptune.convex.com>
Source record: 218275

When I switch to the CW position, there very little tone on the CW signal. Strong signals sound like AM, and only weaker ones produce a tone. This unit uses a tube stage to produce the BFO, unlike the later versions. I have swapped the tube to no avail.

The BFO signal is injected into the detector, 1st audio stage by two leads twisted together. I tried coupling the BFO signal with a small cap (10pf) directly, but this only helped a little. I found that larger values (~200pf) loaded the BFO tank circuit so that the CW tone warbled like crazy.

Has anyone had any experience with this circuit? I know that the S-38 produces good CW tone, because I used one as a Novice 33 years ago.

I have not looked at this circuit with a scope yet. I just thought I would post this in case anyone has seen this before and has a fix handy.

thanks

I played with the Z1A, the 51R and a 79a this last weekend. Both the Z1A
and the 51R have more memories (if MY memory is correct) than the 79a.
The Z1A has a really neat design with the detachable front panel. The
Z1A is also the only one of the three that does not come standard with PL
decode. The local ham store also did not have any accessories/prices for
the Z1A yet.

Audio performance: Z1A, worst of the three - lowest volume level.
51R, second place - low volume level - no mids
79A, best audio. Much improved from my 77a

If I had to pick one right now it would be the 79A. I did not check the
radios out for ease of operation. I did play with all three......none of
them were easy, but I am sure they all could be gotten used to.

re: 6 meter amp.

> Hi, Good Luck!!!

There's a positive reply !

There are several commercial amps to choose from if you have the bucks to put out.

Why don't you build one ? How many watts do you need ? I built a 75 watt linear amp using an MRF497 and a small handful of parts. 10 watts in gives me full power out ! Cost me little more than the price of the transistor.
I also built another one for the car using the PA strip that I salvaged from a surplus Motorola Mitrek commercial rig. I get 110 watts out. Mind you it's biased for Class-C but that's fine since I only use 6M FM in the car. Cost me $25 for the Mitrek and I still had the rest of the rig to use for parts. All I had to do was remove the amp strip, mill down a protruding part that heat sinked one of the wideband transformers then mount it on a large heatsink and build an aluminum enclosure around it.

A little Ham enginuity goes a long way ! I have plans for the MRF497 amp if you are interested.

Duffy, Duffy, Duffy...
I figured there was an underlying problem with Radio Shack and you.
A former employee eh !? I guess there is some bitterness there.
Aside from your opinion of products that you knew back in your days of
employment with RS, too bad you cannot take an objective approach to
some of their new products of which you have no knowledge of but are
quick to prejudge. I personally welcome some competition to the big
3 as well as a greater choice of Amateur products to chose from.
It's nice to see RS offer some products from which their name evolved
...back to their roots. The HTX-202, 404, 212, 2M power amp., DSP,
frequency counter are hopefully just the start. Perhaps not the cream of
the crop but nice to have as a choice.
I'm sure you're aware that retail sales such as at RS, is and has always
been high turnover, relatively low paying work. Typical of mall type
retail chain stores. I guess every store cannot have a licenced ham
whiz kid available to tell you the ins-and-outs of each and ever one of
their products. I can tell you that there are some less than
knowledgeable types at our local Ham stores (and many that I've visisted
in the US). Not everyone can be an expert and I can appreciate that.
I do not worship RS. I'd give you the same response if you were bad
mouthing Icom, Kenwood or Yaesu products of which you have nothing other
than the bitterness of your previous employment with them to base it on.
I own at least 1 rig from IKY and RS. No worship to any one of them and I
am not quick to prejudge any of their products. Personal reviews are most
welcome but loose lipped, unsubstantiated remarks do nothing but display your
anger.
Why don't you buy an HTX-212 then give us your nasty comments about it ?

Regards...Hugh VA3TO Toronto

Ooops !! Correction...
The transistor that I used is an MRF492, not a 497.
Just for those of you who will be wondering how I got 75 watts out of
an MRF497.

>How about rec.radio.amateur.qrp? That includes those of us in rental
>units and CONdos as well as QRP fans (even though I run about 30W ... :).

I'm undecided as to how I'd vote for the proposed group, but the above suggestion is an entirely different topic. I live in an apartment, and have done so for virtually all of my time as a ham (the other time was in a duplex with a small yard, so it still sort of applies). I haven't run much QRP. In fact, the closest I ever really came to QRP was when I was using a loaner HF rig w/ my 4.5 Amp power supply---I had to limit the transmit power to < 10 watts to avoid going beyond the power supply's limits. Even the 30m xcvr I built once ran about 15 watts....

In my current apartment, I have full-sized dipoles folded along the (wood) stairs (like many buildings along the coast, and particularly here on the island, this apartment building is built on stilts to help protect it from storm surge in a hurricane/himicane). When I run voice (rare) or cw, I run a full 100 watts. When I run AMTOR/PacTOR, my HF rig automatically cuts the power down to about 50 watts due to the high duty cycle.

Do I have RFI problems? Nope. I did, briefly, when a neighbor had a quick-disconnect cable between his TV and VCR, but that took a few seconds to fix, and has never re-appeared.

If anything, though, I think a QRP group would be more fitting than a sub-group for restricted space antennas, which, IMHO, is probably ok right here.

Just my $0.02, all IMHO, of course.

Source record: 218380
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Netters:

I received a 79 for my birthday (my wife is an Advanced licensee who understands these things)--great rig, nice improvement over my old 77. The external power circuit is different, though, and I'm curious if everyone else's take on it is the same as mine.

The 77 disconnects the battery when external power is applied. Drop in charging and external powering can work simultaneously, or the battery can be removed altogether and charged with the wall transformer charger.

The 79 charges the battery through the external DC jack. Looks like that jack provides 100 mA regulated for battery charging, so that shouldn't be left connected indefinitely to a 600 mAh battery. Does that mean the 79 can't be left plugged in for external powering? Can't leave it in place for packet, etc? Or run it at high power plugged in if the battery is nearly dead?

Let me know..

IMHO this is a much better idea then the current name. My feeling is
there is a much broader base of users for qrp, and it could include the
low profile people also, since they seldom run 1000 watts.

I've had very good results by cutting a piece of wire to a quarter
wave and then taking an electronic connector filing two notches in
it so that it will fit over the BNC connector. Works escpecially
well with the window type adapters used for mobile applications where
the antenna is no longer connected to any metal, good luck.

>
>Thanks in advance.

Jean-Francois,
I have been using a tm251 for about 8 months and it is a very good
2m mobile, excellent imod rejection and a very nice squelch
circuit. There is a seperate connector on the rear for vhf
packet and 1200/9600 is menu selectable. There is NO built-in
TNC. The rear connector gives you very fast TR switvhing and
direct discriminator audio. Yhe menu system is good, but you will
need the manual. This mobile has lots of power, mine showed 65W
out on a bird wattmeter.

The DRS is a digital recorder for recieve, it will play back a portion
of what you hear, i never used it because i have a life! ;-)

Message-ID: <ZIELKE.95Apr25105615@sherlock-hemlock.muppets>
Source record: 218387

Hello All,

I am currently in the process of trying to setup a HF station aboard my 35' sailboat and I have not been involved in amateur for some years do to being in college and not having access to a station. At any rate, what I am looking for is a recommendation for a rig/tuner which will do a good job feeding the backstay of the sailboat. It will be an insulated section about 35 to 40' long.

Specifically I have not previously used rigs with solid state finals and so have little information about the modern rigs and tuners. I am looking for used gear at a reasonable price and the 'latest and greatest' is not necessary. However, I think that one of the automatic antenna tuners would be a real asset. I have heard that the internal antenna tuners do not work well with an insulated backstay but that many of the external tuners work quite well in this configuration.

Thanks!

Well if you want to know what my problem is concerning the rat shack.
I worked for them for six years. I was one of the top salespeople in
my area. I resigned because I could no longer stand the reduction in
quality that I saw year after year. When I first started with them,
the quality of the products were good. In order to cut cost and
maintain ridiculously high margins, RS lowered the quality. Yes it is
my opinion. It would be yours too if you made an objective comparison
between other known, name brand manufacturers.

As far as the RS comparison in the store. Do you really think that RS
is going to put their product in an unfavorable light compared to other
products? Every manufacturer puts out comparisons that shows theirs is
the best.

What is the difference where it is made? QUALITY is the difference.
RS makes stuff in Korea not because they produce the highest quality
goods for the dollar, they make it there because it is cheap. Look
inside the radios sold by RS and compare it to other manufacturers
goods. If you cannot see the obvious difference in quality of
manufacture and quality of components, then let me sell you this great
piece of land I own in Florida. It is really attractive when the tide
goes out.

There is no ax to grind, I did really well at the shack and was one of the longest surviving employees they had (notice the continual turnover?). I just could no longer stomach selling junk at high prices.

Regards,

Duffy

Hi there...

I am in need of ANY information on the Realistic COMP-100 scanner. This
is a very old scanner, and uses 'binary' switch's to program it.

If you think you can help me out anyway, please mail me at my address...

Thanks...

3256. Re: Dual-band mobile recommendations

>especially the Alinco. I'd also like to know if there are any other
>units that are DTMF-controllable via an HT.
>

I just purchased an IC2700H. I also had the problem of mounting
a radio in my truck so a radio with a detachable faceplate was
a must. The ICOM is a great radio. It has all the bells and whistles
that you need. It does do cross band repeat which can be activated
remotely by a HT using DTMF tones. Matter of fact, you can control
almost the entire radio remotely via a HT (ie change frequencies, change power
levels, etc) If you get the optional voice synthesizer you can actually
remotely have the radio tell you what frequency you're on. An automatic
timeout feature can also be programmed to turn the radio off if you don't
use it for 30 minutes or 1 hour or 2 hours.

There is a mod to make the radio receive extended frequency ranges.
ICOM is also offering (at least they were) a free InfraRed Microphone.
It acutally works and it works well. I thought I would never use it
but I do. No microphone cable getting the way anymore. This is a $150
option.

InterMod is typical for a dualbander.

The only drawback is the price. To get the radio, separation kit and
voice synthesizer ran almost $900. The radio itself is around $760.
The radio is a winner however!

Ah, you are looking at this horse from the wrong end. The S-38 is
from the days before product detectors. The ratio of the BFO signal
strength to the desired signal's strength is critical to low distortion
performance. If the BFO is markedly weaker than the signal, you get
the symptoms you report, if the BFO is markedly stronger than the
signal, you get another set of symptoms that are worse. So, the BFO
is made weak in order to reproduce weak signals properly, and a manual
RF gain control is provided so you can reduce the strength of strong
signals to the same level. In other words, you are experiencing pilot
error.

tschuld@gpu.srv.ualberta.ca (Chris Dorn) wrote:

> I am currently working toward my license, and am trying to learn about
>some of the older radios; transmitters and transceivers.

Hi Chris,

Considering that you're not licensed to transmit yet, you can afford to take your time with this decision. My suggestion is to try and learn as much as possible about the different features available, in a generic sense, then look over the older gear to see what you can afford. The best source for info on the equipment itself will probably be back issues of QST, CQ etc. Maybe you can locate a local ham who will let you browse through his collection, or maybe your local library has these.

Actually, even after you become familiar with the older models, there will be questions you can't answer for yourself until you've been on the air awhile. The reason for this is that different rigs place varying emphasis on features for different modes (like CW or 'phone). You won't know which modes you really enjoy, or features that will be the most useful, without on-air experience. Again, take your time, then take your best shot. The worst-case scenario if you goof is that you may have to "trade up" a little sooner.

I am in the process of writing a draft for an article about batteries,
and would like input from you about the following:

======================== NICAD SECTION ======================

1. If you use the stock FNB-25 (or is it FNB-17?) battery, on average use,
how long will a charge on

low power last?

On high power?

2. Do you use:

the quick (3 hour) charger? or

stock wall charger? or

continuously charge it as you are talking through a cigarette lighter plug?

3. When the battery dies, after a recharge, how long will it last on

low power?

high power?

4. Approximately how many times a week do you recharge it?

5. If you use the quick charger, after how many charges have you seen a
descrease in its ability to hold a charge?

6. What is the average current draw on:

low power?

high power?

================== Dry-cell Section ==========================

1. If you use the AA dry-cell pack, how long does a set of batteries last on
average use

on low power?

on high power?

2. Do you use alkaline or Nicad AA batteries?

3. How much money do you spend on average on a pack of 6 AA cells?

4. What is the average current draw on:

low power?

high power?

============== Combination Section ======================

1. If you use both the AA and Nicad packs, which tends to last longer?

2. Which do you use most often?

============== Miscellaneous Section ======================

If you have any other information you feel would be appropriate, please
feel free to send it to me.

==================== END of survey ======================

If you take the survey, all received copies will be summed and averaged.

No person or callsign who submits a completed survey will be mentioned in
the article. (Sorry).

Please answer as best you can.

Thank you very much for your time. If you have any questions or
comments about the survey, ** PLEASE ** e-mail me direct if possible.

My e-mail addresses are: wy1z@neu.edu or scotte@ccs.neu.edu

>can't be left plugged in for external powering? Can't leave it in place
>for packet, etc? Or run it at high power plugged in if the battery is
>nearly dead?

Just unplug the battery when you want to run the radio from an
external power source. It's inconvenient, but it works.

I think the manual should have been more clear on this subject. It
tells you not to overcharge the battery, and it tells you that the
external power jack can be used to power the radio, but it never
specifically warns you to remove the battery before powering it from
the external jack for extended periods. Of course, it's obvious if you
read the schematic... :-)

One word of caution: the radio gets hot very fast when you transmit at
high power with a 12V supply. I would think twice before running it at
high power from 12V unattended (such as on a packet digipeater).

Have fun with your new toy!

And some wisdom from davev@atkc.COM (Dave van De Kerk)

:As an apartment dweller and a radio amateur interested in
:HF CW, this group is exactly what I am looking for. It is
:not just limited to discussion about antennas. Topics I
:forsee include:

* dealing with landlords and covenants
* TVI and RFI to others
* TVI and RFI interference to your operation from
others.
* negotiations with neighbors on operating
* strategies for HF operations to stations out of
your own state on extremely ineffecient antennas
and low power.
* RF safety in extreme proximity.
* operating satellites with low profile equipment.
* Urban emergency operations using rapidly deployed,

improvised installations.
* Care and feeding of the older, less expensive
equipment us "stealth" operators seem to use.
* Installation of the shack in very space challenged
areas that the XYL or other significant other
lets us use.
* How to get a good ground on the 27th story.

:None of those topics are related to antennas. Of course, I
:also would include:

* help with making an HF antenna that is nearly
invisible and gets out.
* invisible commercial HF antennas.
* help with making a VHF or UHF antenna that is nearly
invisible and gets out.
* invisible commercial VHF/UHF antennas.
* antenna modeling
* antenna installation tips and hints

:For those of us who are not rich, never will be rich, and have
:less space to work with all the time, this group looks wonderful.
:Please vote yes.

Low-profile ham radio is an extremely challanging and highly specialized
pursuit of the Hobby. As quoted herein, there are a myriad of subjects
that need to be cussed and discussed. I have been a fan of operating
my HF station under all kinds of conditions, mobile and portable and
I highly endorse this newsgroup. Just because some of us are fortunate
enough to have full-size dipoles and gain antennas NOW, remember that it
wasn't always this way and that there are others who need this exchange of
specialized information to learn and experiment to improve their skills
and talents in this area.

If the Net can support 8,000 + newsgroups, would one more really make a
difference? Next tine you take a trip, try taking along a 40M QRP
transciever and some magnet wire and try to make a contact or two.
This kind of activity can be great therapy after a day full of snake-pit
business meetings. Try working some of your buddies back home from your
Company-paid hotel room. Its a lot of fun! At least if you are not into
trying this, you may find it enjoyable and entertaining to read the experience
of others. Remember, the basis of our Hobby and license is EXPERIMENTATION!
With the proliferation of consumer-grade transcievers and "rice rockets"
which are not generally user-servicable, can any of you tell me any areas
of research and experimentation other than antennas and operating under
low-profile conditions? So, loosen up you detractors, and think before
you condemn! No one's twisting your arm to read or participate in this
proposed newsgroup. You probably wouldn't have much to contribute anyways!

Donning asbestos suit! Fire away! But no replies until after Dayton!

?

The reason for a group is to be if there will be sustainable discussions. This group is being proposed has a *lot* to do with rec.radio.amateur.antenna with a bit of the inflamatory rec.radio.amateur.policy thrown in to boot. If the existing group structure can support discussions proposed in the group, then one should ask `Why do some people feel the existing group is inappropriate for this discussion'.

>Next tine you take a trip, try taking along a 40M QRP

I use one now for packet and seems to work ok. One problem though, unlike some other ICOM radios, (735 and some other 2m mobiles), the audio output does NOT appear on pin 8 on the mic connector, you need to connect to the speaker output on the back panel, therefore I believe a 'standard PK232 - ICOM' cable would not work. Good Luck.

Craig,

The PLL board went out ????? What do you mean ? I would say that is very unusal. What are the systoms?
You might try posting a e-mail to 75540.525@compuserve.com this will get you to Icom directly and do describe the problems.
I do not think icom will have an entire circuit board, as they do go right to componet level for repairs.

>
>do you use?
> I'm new at this DX stuff.

I have used the yaesy ft-840 HF transciever, and the rx section
is reorted to be directly from the frg-100. It is a nice unit
with excellent audio. I think that the wide-am option, if it is an
option, is essential for fidelity on SW broadcasters. The 2.4 kHz
filter is just too tight. But, the selectivity and sensitivity are there,
and the freq display is right on the money.

clock problems?
speaker mods?
I have no idea, but you will not be wanting for audio!

As for an antenna, make a decision on how much space you have
available, if you can put it outdoors, and if so, how high. I
have used a big dipole, the same one i use for Amateur HF,
135' long and 30 feet up (soon to be higher) and that thing
hears very well. My grandfather uses a window screen! whatever
fits your needs.

good luck

3275. EZSSTV and the PK-900 - IT WORKS GREAT!!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-26 00:00:00 UTC
From: willhelm@ix.netcom.com
Message-ID: <3nlspo$9fp@ixnews3.ix.netcom.com>
Source record: 218308

The shareware program EZSSTV and the Aea Pk-900 are a good combination. I downloaded the software from a ham radio area on the internet (email me if you need the address info) and they work well together. Image quality is excellent and the PK-900 does a nice job. The PK-900 is automatically set up by the software so you dont have to do a lot of confusing commands. Anyway, for those with a PK-900 and who want to try out this interesting mode its a winner. According to the software docs EZSSTV is just a scaled down version of PASOKON SSTV. But its free and works well so who could complain. Try it and if you need additional info just email me. Thanks for reading....Bill

3276. Re: WTB ICOM-228H or ICOM-229H

> good, working radio, not banged up, with "everything that came in the
> box, when new".

> Please email information about what you have to sell in this regard.

Another kind netter asked me to post precisely what I am looking for and the range of value/price that is important to me, to set expectations properly. I am asking these questions and making these statements, so that we know the details of what we are talking about and how to deal with it.

--> The questions I am asking:

How long have you had it? Purchase date: From whom:

What is the serial number?

Is it modified? Out of band, special functions, anything changed?

Is it working properly?

How does it look? "Like new, or buttons worn/need replaced"?

Does "everything else in the box, when new and the box" come with it?

What else comes with it?

Would you please include a schematic for the packet connector/cables?

Would you please the instructions for out-of-band modification that you have?

Anything else you want to say/offer?

RE:----------

ICOM-229H/228H value:

Amateur Radio Electronics offered the last sale price for a 229H of $329.
Amateur Radio Electronics offered the last sale price for a 228H of $305.
Note that these radios are not "current equipment", nor available new.

Included in the box was:

ICOM-229H, original equipment and functionality: (OE = Original Equipment)
Original, dated purchase receipt (establishes ownership and date).
Original box, with serial number on the outside.

Instruction/Owner's Manual.
High-Power 12V red/black cable w/power connector.
Mounting bracket and screws/washers.
FEATURES:
DTMF keyboard on microphone, with autodialer.
CTCSS subaudible tone encoder.
20 memories.
programmable call channel and offsets.
battery saver mode.

ICOM-228H, original equipment and functionality: (OE = Original Equipment)
Original, dated purchase receipt (establishes ownership and date).
Original box, with serial number on the outside.
Instruction/Owner's Manual.
High-Power 12V red/black cable w/power connector.
Mounting bracket and screws/washers.
FEATURES:
DTMF keyboard on microphone, without autodialer.
CTCSS subaudible tone encoder.
20 memories.
programmable call channel and offsets.
battery saver mode.

Generally, electronics depreciate approximately 1/4 to 1/2 of their
"last new price", after 1 year.

I value a 228H or 229H with serial number > 50,000, with an original
purchase receipt < 1 year old as worth 80% of "last sale price".

- < 1yr and > 50,000, 80% 228H $244, 229H $263. "$250 ballpark".
- < 2yr and > 40,000, 70% 228H $213, 229H $230. "$220 ballpark".
- < 5yr and > 20,000, 50% 228H $152, 229H $164. "$155 ballpark".
- > 5yr and > 2,000 $100, < 2,000 $80.

Note that you are unlikely to get a better offer than the above, even
after diligent effort and time invested on your part. I have researched
the specific equipment I am willing to buy. That has resulted in these
numbers, for how I value the equipment. If you are uncomfortable with
my valuation, it is ok for you to elect not to sell your equipment to me.

Terms of sale (if I am involved):
I US Mail a check to you for our agreed upon price.

- This way you avoid the COD charge.
- You pay for shipping UPS, packaging, the sale price amount of insurance.
- You may hold the unit until my check clears your bank,
but not longer than 2 weeks. If you can't ship the unit in
2 weeks, you will return my check.

This buys me the following:

- A signed receipt (which I provide and you sign and return to me).
- Your unit and (OE), everything that came in the box new and the box.

- Other items and accessorys, as described here.
--> NONE <--

- If I find that the unit is not acceptable, or not as described herein, I may return it within 2 weeks of receipt. Within 2 weeks you will US Mail me a check for our agreed upon price, less your shipping and insurance cost. For this consideration, I will incur the full cost of shipping and insurance both ways and you will be out no $$, only packaging and time.

Two questions for happy owners of the above Standard brand HT's:

1. Is there a short version of the sliding TTP cover? If not, that's too bad, cuz when you use a 4-cell alkaline battery pack, you the standard sliding cover is too long!

2. Are there any interesting mods you've discovered for these rigs? I have the 220 MHz version. Just received it yesterday. Neat rig; I like the fact that it will receive the 2m band, etc.

Thank you for delaying your trip to Dayton just to answer my lame questions. Adios and 73, Andy

I own the Icom IC2700 w/ voice and tone decode modules and infared mic. Very pleased with it so far. Routinely use cross-band repeat function. I find it very important to have tone-decode in the radio so the cross band repeat approach doesn't rebroadcast intermod or incidental on-freq stuff I didn't expect to be on my chosen simplex freq. Radio is very susceptible to intermod, as is common with wide-banded radios. Most of the time it's not a problem - unless you live in a very RF-rich region (big City?).

Steve, there is almost no 10 meter activity anywhere now due to the low of this cycle. As far as the Radio Shack DSP is concerned,save your money,it is totally usless and not worth more than the cost of a cheap speaker.I bought and used one for a couple of days pefore returning it for a refund. A friend of mine introduced me to the Timewave DSP9+ and that unit is a real DSP with static reduction and good filtering for the digital modes it is sure worth the price,forget the Radio Shack you sure don't get what you pay for.

From: rburgan@detroit.freenet.org
Message-ID: <3nm51f$6j0@detroit.freenet.org>
Source record: 218320

Best way to do it, along the lines of the previous answer, is
to use the same method Hallicrafters worked out...bring the lead
from the switch as follows:
For correct BFO operation, vary the coupling between lead E
and pins 4 and 8 of the 12SG7 tube for a maximum beat note.
Pushing lead E toward pin 4 increases the strength of the beat.
(Lead E is the long wire from the switch going cross chassis to
the 12SG7 socket.)
[This is from the S-38C Manual]

3297. HF Mobile Installation Advice Request

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-26 00:00:00 UTC
From: weltyrc@mail.auburn.edu
Message-ID: <D7MMIJ.D0z@mail.auburn.edu>
Source record: 218330
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

Picture this: 2 college aged hams mobile from Auburn Univ, AL to Dayton, Ohio. The car: a Ford Festiva (don't laugh). The rig: Kenwood ts450. The antenna: Outbacker Perth. The question: How do I maximize performance on th HF bands? I have ignition/engine noise that kills 90% of the signals when the car is running. Also, a brief test on 80m shows we can't be heard across town.

Please send me your advice on HF mobile, especially Outbacker specific.

tnx & 73,

3298. Help on QSO

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-26 00:00:00 UTC
From: EISTM@ccmail.ceco.com
Message-ID: <9503267989.AA798904149@ccmail.ceco.com>
Source record: 218331

Hello Netizens:

I got my tech class license long time ago. But kind of lost interest and
left it without even QSOing once. Last week
I got my first ham equipment (a 2m HT).

Right now I dont know what to do

I choose a freq and sent a voice CQ call for a minute. I didnt get any
reply.
There were quite a few people talking 2 each other on other freqs. Is it a
good practice to join them ?
(ie how do i talk to them ? is there anything that i should do to tell them
I want to join their conversation ?)

I hear CW between conversations being transmitted in 2m. What is its exact
use ?

How do I contact using the repeater ?

How can I find out the repeater freq in my area ?
(I am in Wheaton,Illinois a suburb of Chicago zip code : 60187)

There are a lot of questions. Even if you could answer few of them that
would be great and I will very much appreciate if u could reply 2 me
directly (since I dont have direct access to Usenet)

Thanx a lot.

73s
Thiaga Manian (eistm@ccmail.ceco.com)

>>any of the currently produced HT's have a mod for listening to public
>>safety 800 MHz as well as 450-512 MHz.
>>
The Icom IC-W2A if you the keyboard mod (a series of key strokes)
I did this to my radio some time back. If you want to know how to
do the keyboard mod I will postit for the group (I have to rember
to bring it from the house). IF you call Icom they will tell you
how to do it also. You end up with 120mhz(maybe lower) to 900mhz
with some very minor gaps. You can rx 800-900Mhz soild and as for
450-512mhz no problem.

I've got some other usefull info about some hardware mods and
another "keyboard" mod.

I have a Kenwood 79A that I use and like very much. I would assume,
but would like to be assured by someone who knows...
If I get a 79A(D) for my wife, will we still be able to
use the "clone" function of the handheld?

Thanks.

I agree with the above, have also made my own 1/4 ground wire and works
as well as the Over Priced Tiger Tail.

I've had excellent results doing this escpecially in situations using
a mag mount not connected to any metal and using those window mounts
that also don't connect to any metal.

I played with the Yaesu 8500 last night. Very nice radio. Interesting configuration with the
mic. Have you considered the Kenwood 733A? It is a very nice radio as well. I'm also looking
to purchase one in the next few days and I'm planning on some serious shopping at the Dayton
Hamvention. I'd like to check out the Alinco. They have a new 710 they will be showing off at
Dayton. The Kenwood 733A is also remote controllable.

They are out of business because Rat Shack bought back
their franchise. I assume -- that is I assume--no fact implied
just logic applied, that the other stores bitched about their
pricing. At Radio Shack margins they could more than afford
to ship for free.

As to being a Guru have some one noninvolved read two or
three hundred of your posts. It is hard for me to believe
you are not intimately involved with Radio Shack management.
I believe you that you are not but the appearance is very
convincing.

3308. Re: Radio Shack 2 m amp. good?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-27 00:00:00 UTC
From: Bob Winingham <kc5ejk@onramp.net>
Message-ID: <3nn605$cta@news.onramp.net>
Source record: 218202

I tested the unit and got:
input output
1 22 Watts LOW power on HTX-202 HT
2 28 Watts HI- power on HTX-202 HT

This was from the internal batt:

When I used a 13.5 V external Batt. I got 30.5 Watts output
All testing same equipment and DAIWA 30/300 Watt SWR meter NS-663B

This is about the save as I got from another 2-m Amp that was
rated for 35 Watts output

I have bought a EAR-TALK, the earpiece mike from a company advertising in QST and they are great. The audio is good and the volume control handy (they have secondary volume control). You clip the switch/volume assembly on a belt, hook the earpiece in the ear and stock the Kenwood connector into the rig (I use it with a 79A).
It works great. They cost $39.95, although mine cost more than $50 when I bought it.

From: jhoffman@ccnet.com
Message-ID: <jhoffman-2704950015580001@h98-196.ccnet.com>
Source record: 218206

A friend of mine and I just bought the TM-742a. The radio is really cool untill you try to key up on 10 meters with high and med power 50/15 watts. This is happening to both of our radios where the tx will lock on and cont key up untill you turn the radio off. I tried calling Kenwood and they have never heard of this problem. Any info on this would be great. So if you have any answers for this please Email me at jhoffman@ccnet.com

thanks in advance

From: jls <jls@sierra.net>
Message-ID: <3nomib$447@jobes.sierra.net>
Source record: 218208

> Hi. I was wondering if anyone had any experience with throat or ear mikes. I
> am looking to get one or the other for use when riding my motorcycle, but
> would like some feedback.

I use one on my motorcycle made by a company called Genisys, model
#T-05. It sounds very different when I talk on it from my normal
voice, so much different that many times people who know me don't
even recognize me. It is good for not picking up road or wind noise
though since it picks up vibrations from your throat to generate its
signal.

The quality is only OK, I wish it was made more durable because when
you're using something like this it is usually a field item that is
not just used while sitting in you living room. Mine has already had
a couple problems in the wiring and I've had to tear it open and
rewire it twice with better quality wire.

The price is also quite steep at $90 for a medium quality product, but
since it's the only one that I found available what can you do. It
does work pretty well for my intended purpose so it's better than
nothing I guess. Sorry I can't tell you where to purchase one but
I think they are pretty available, I got mine from a acc. dealer at
a ham swap in Sacramento, CA. Good luck.

Date: 1995-04-27 00:00:00 UTC
From: haworth@Direct.CA
Message-ID: <3norl5$mn9@stud.Direct.CA>
Source record: 218209

Anyone able to tell me how long an article is allowed to stay on this news group?

I've posted an enquiry re a mod for 737A, but seems to disappear after a day or so?

I'm relatively new to the "net" so would appreciate anyone telling me about
the "policies" for posting art. to this group.

thanks

Chris Dorn (tschuld@gpu.srv.ualberta.ca) wrote:
: I am considering a license for amateur radio, and own a Drake R8. Can
: the R8 be used alongside a transmitter? If so, what transmitters would be

Certainly. In fact, this is one of the preferred ways toward
"bootstrapping" your way to a station you built yourself. The
receiver is used for troubleshooting and testing the transmitter.

The preferred way for beginners to handle T/R switching is to use
a mechanical relay or switch. Yeah, I know--ancient technology.
But have you done an fault analysis of a miswired PIN diode T/R switch?
Its a lot easier to make sure your relay is hooked up correctly
with an ohmmmeter.

: most suitable? Does anyone still manufacture transmitters? What about the

Japan Radio Corporation and Harris still make transmitters. But, since they
cost *more* than typical transceivers, hardly anyone goes that route. I
think demand and economies of scale play a big part--transceivers aren't
that much more expensive than receivers.

: 6 and 2m bands? I would like to add to my existing equipment rather than

Down East Microwave in Frenchtown NJ and SSB Electronics USA supply
transverters for the 6 and 2 meter bands (28 MHz IF). Ten Tec has
been selling an $100? 6 M kit (14 MHz IF) that has been discussed
here on the net.

: investing in a new transceiver.

The answer to your question is a little known feature called a time out timer. To set the timer you turn the radio on while depressing the pwoer and adjacent button simultaneously. You can then set the timer with the freq. knob. Hope this will help!

3325. th78a: problem with mods

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-27 00:00:00 UTC
From: 4z9chb@pc.4z7aba.ampr.ORG
Message-ID: <43230@pc.4z7aba.ampr.org>
Source record: 218337

Hi Rich,
As Glenn said, you should change back the steps. Changing the steps is taking place only if you are in VFO.
I own a th78e for about 2 years and has all the mods. My HT receives in the VHF from about 90MHz to 180MHz, transmit from 136 to 180 and on UHF receives from 400-512 and transmits from 400 to 500+. On the 800 band, it receives pretty good, and also on the 900MHz band.

Also, I have only one problem with this HT, the speaker jack is not good, and when I plug in an earphone, it starts changing the freq, like I am using the function keys in the speaker/mic SMC-33/34.

Good luck with this HT.

From: 4z9chb@pc.4z7aba.ampr.ORG
Message-ID: <43232@pc.4z7aba.ampr.org>
Source record: 218338

Hi,

I own a 50cm rubber antenna for 144/430/900 bands.
The lenght of it is 47cm. Its gain on 144MHz is 2.15dBi, on 430MHz 3.8dB and on 900MHz 5.5dB.
I am quite satisfied with this antenna. I usually use it on trips and on portable activities.
This antenna is called "High-Grade Antenna" and the model is HX9000. It is made in Japan. I bought it in England.

According to the manufacture, it is a good antenna for receiving the following bands: Air-Band, 150, 300, 450, 800.

All the best,
Ohad Miller, 4Z9CHB

>not overcharged.Failure to fully charge the battery prior to use will
>cause the memory effect especialy if this often happens.
<snip>

Memory is an often misdiagnosed problem. The designs used in the manufacture of newer Ni-Cads will normally prevent any permanent memory. If you suspect your battery has developed a "memory", a couple of full discharge/recharge cycles will normally bring it back right back to normal. If it doesn't come back, it may have a damaged cell rather than memory. Poor maintenance can result in cell reversal, venting or other damage. A bad cell in your battery pack may cause problems that are too often blamed on memory.

I have followed the following guidlines with every Ni-Cad I use in my HT, Norelco razor, cordless phone, drill motor, stuff at the office, etc. I have found this to be a good "do's and don't's" list. Some of this stuff was in MRT quite a while back.

DON'T

- CONTINUOUSLY discharge Ni-Cads at at rate more than 2X the capacity.
- Short the terminals - be careful about putting batteries in your pocket with keys, change, chewing gum wrappers, etc.
- Recharge cold batteries. They can burst, vent, leak or otherwise "break".
- Let Ni-Cads discharge to below 1V per cell.
- Reacharge wet batteries. Let them dry out before charging.
- Leave batteries on trickle charge for a long time.

DO

- Charge Ni-Cads at room temperature. 40F or warmer (60F for fast charge) The capacity and charging times on most Ni-Cads are normally for operations at 70F.
- Wait for low battery indicators before recharging. I wait for the "BATT LOW" indicators to start blinking on my phone and radios before recharging.

- Realize that rapid chargers (like the 1 hour type) will shorten the overall life of a battery by up to 40%. Most good Ni-Cads can take about 1000 cycles if cared for correctly and slow charged.
- Remember that most fast chargers (should) switch to a trickle charge rate before the cells are fully charged to keep them from overheating. A couple of hours of trickle charge is required to "top them off".

Following these guidlines my razor ran for a week on one charge over 5 years, the cordless phone will go 4 to 6 days (with my use), and I don't complain about the life of my HT batteries on my ham or commercial radios.

MANY THANKS, Doug!!!
Tried this, it was set to 6 - I'm assuming this is 6 minutes. Not very
long for a very active net when crossbanding, which is xmitting
constantly. Choices are from 0 through 60, I guess 0 is turning the
time-out off.

I'm suprised this was not included in the user's manual. But neither were
instructions to turn on crossband repeat! Any other 'features' like these
you might know that aren't in the manual??

Again, many thanks
73 de Tom KC5HEG

This sounds like you built a class-C amplifier. A class-C amplifier
is only suitable for FM and CW modes, not AM or SSB.

>I also built another one for the car using the PA strip that I salvaged
>from a surplus Motorola Mitrek commercial rig. I get 110 watts out. Mind

>to use for parts. All I had to do was remove the amp strip, mill down
>a protruding part that heat sinked one of the wideband transformers then
>mount it on a large heatsink and build an aluminum enclosure around it.

Why not just remove the receiver/exciter board from the Mitrek and
use the Mitrek case/heat sink that came with the PA?

What did you do for a T/R switch?

I tend to think people looking for amplifiers to follow transverters
with an all-mode exciter will want all-mode capability which rules
out class-C, or at least requires class-AB or class-A.

for one
RA>more HQ...
RA>Interested in100A, 200, 145A + speaker
RA>Not working OK-- all there, no front panel mods please!

Hi Randy!

I have an HQ-145X in working condition you might like. No mods
of any kind, and in reasonable shape. The clock face as a half
inch or so crack, and there's a 1/4" vertical scratch just to the
right of the clock. Other than the usual light scratches around
the outer trim ring, that's it. The set works and shows no
signs of internal repairs.

Price $160 + shipping from Nashua, NH via UPS or your choice.

> Misc: CW only, US Military receiver.

Well, I must say that this brings back the past. The 348 was my first receiver. I purchased it at a hamfest for $15.00 brand new still in the shipping case. I borrowed a lab supply at first to run the dynamotor. I can still remember it humming away. I later built an AC supply with a transformer I got from fair radio, got the tech. information from them also. Mainly an AM and CW receiver I later made a number of mods. the first was to add product detection and build a converter for 15 meters. If you are not asking an arm and a leg I am interested for old times sake.

3343. [EQUIPMENT] value of this radio?

Most selector magnets are intended to be series connected and driven with
20 to 30 ma or 60 ma when parallel connected. You need a minimum of
about 40 volts, preferably 100 or so, and a series resistance to reduce
the time constant (Lcoil/Rseries) to less than a few milliseconds.

>To throw more fat on the fire, you might have a
>"line repeator" or "polar" relay in the loop
>with the selector relay, which complicates things.
>I hope this will get you started.

If so, disconnect the polar relay and directly connect to the selector
magnets. The polar relay isn't much use with local loops anyway; it was
used to generate and detect bipolar signalling over long loops.

Date: 1995-04-28 00:00:00 UTC
From: sslavsky@acq.osd.mil
Message-ID: <2122420828041995.A26548.BETA.1194E22A1500*@MHS>
Source record: 218230

The problem with repackaging and then reselling returned merchandise as new is not limited to Radio Shack. It has happened to me at several of the better known consumer electronics (not ham radio) stores in the Washington, DC area. One time I purchased a fairly high end VCR, checked the box and it looked factory sealed. When I got it home it was all wrapped like new - but I found a video tape in the VCR someone had made of football games from a few months earlier. Needless to say, I returned the unit, yelled at the store manager, who didn't seem to think anything was wrong with their practice, and got a refund.
With Radio Shack, I check the unit before I leave the store, no matter what I buy there - it is generally apparent when something has been returned. The good thing is, they have never refused to take back an item, so that is a big plus (also the 5 year warranty). Its caveat emptor out there - you pays your money and you takes your chances. All you can do is be vigilant and try your best to reduce the possibility of getting someone elses cast off as new.

Source record: 218233

FOR SALE: TEKTRONIX 212 OSCILLOSCOPE
^^^^^^^^^ ^^^^^^^^^^^^^^^^^^^^^^^^^^^^

This is a PORTABLE 500 kHz scope designed for general purpose
applications. Operable from AC line voltage as well.

Verticle deflection ranges from 1 mV to 50 V per division. Horizontal
deflection ranges from 500 mS to 5 uS. Uncalibrated sweep rates, via a
variable sweep magnifier, are available to at least 5 times the indicated
sweep rate -- maximum 1 uS. X-Y operation is available.

Unit is 3.4 lb, 3" high, 5.25" wide, and 8.9" deep. The only minor
inconvenience is a dim CRT display. However, traces can be seen in a
dimly lit room. Otherwise completely functional.

$700+ shipping. I am selling this for a friend. Reply to my account if
interested and I will inform the owner.

Duain Jansen N0MKB asks:

>Does anyone know of any place I can download a program to help with my
>logging of contacts? I have heard that there are logbooks on disk or
>something. I have not heard of these. Do they run under windows? If you
>know anything about these, please let me know.

QST in May has an article by Lauren Rudd, KD8PZ titled "Let Your PC Do the Logging". The article reviewed many of the "popular" logging programs for both Windows and DOS formats.

Unfortunately, left out was the one that I find the most useful. It is QLOG by Antonio Pinto IK5HGL. It normally runs under the DOS environment but of course can run as a DOS program under windows.

It is an easy to use program which allows you to import other computerized logs (for instance from contest loggers), prints QSL labels and has Packet interfacing for DX spotting networks.

I've looked at a lot of logging programs and have found that for everyday logging, this is the one I prefer. I have tried his version 2.06 but he has recently sent his latest version to oak.oakland.edu and to ftp.funet.fi where they should be shortly available via ftp. If you don't find his latest version qlog300e.zip then get then get the previous version qlog206e.zip and see how you like it. Since it is shareware, you get to try it out before you spend the bucks, so you can't go wrong by checking this one out.

If you know Italian you can get the Italian version qlog206.zip or qlog300.zip, otherwise make sure you get the one with the e after the version number.

I think a logging program is a personal thing and you may have to try several before you find one that you like... You might as well check out the shareware versions first.

It all depends on what your looking for in a logging program. I found what I needed in QLOG, I hope you find one that suits your needs also.

There's lots you can do. Go to your local ham radio store, ask about local clubs, pick up an intro to amateur radio book or the like, get in touch with the American Radio Relay League in Newington, Conn., visit a local library and look at monthly periodicals like CQ, 73, or QST magazines, AND LISTEN to your HT to learn some of practices. Those are good ways to start.

Greetings fellow hams,

I have been looking at all the ads on 2m/70cm handhelds
and am about to buy a Kenwood TH79A(D). One of my
requirements is to have good aviation band reception
for my flying activities. I have all ICOM gear at
home, but this TH79 seems like exactly what I need though
the Yaesu FT51R looks promising too. I am not a big fan
of all the bells and whistles, and generally see it as
useless features, so that in itself does not drive my
decision.

Comments please ... before I spend my hard earned money.

Steve Slavsky (sslavsky@acq.osd.mil) wrote:
: Does anyone know if there is any 10 meter FM/repeater activity in the
: greater Washington, DC area or elsewhere? I am thinking of getting the FM
: board for my FT-840, but don't know if it is worth it. Also, is anyone
: using the Radio Shack DSP unit which is on sale this month for $50 or so?
: I think it has an amp and internal speaker and runs from the headphone
: jack, but am not sure. Does it do a good job on SSB and CW signals?

There is a 10m repeater in the area, I was able to hit it from my hotel
room in bethesda. I don't have my repeater guide handy so I can't post
the frequency. It has a 440 link and is active around rush hour, but not
much else.

When I was on it I was told several times that the repeater had a 10m side
and really had coverage when 10m was open. I was also told that 440 in general
was not very active in the area.

You will also need CTCSS for your transceiver, almost every 10m repeater is
PL'ed. There is some simplex activity in the Philadlephia area on 29.6000.

As, for the Radio Shack DSP, it is not a replacement for a narrow IF filter,
but it does help it removes little noise, but it does remove QRM. It will
remove any solid tone (hetrodynes, CW, etc) in voice mode and does a good
job of removing voices etc in CW mode. Personaly, for CW, I would recommend
a good narrow filter about 500hz. Narrower ones tend to "ring".

73,

Geoff.

I own the Yaesu FT51R and occasionally use it for AM Air Band RX. Seems
to work well there. As to all the bells and whistles, I disable all the
ones that eat up battery power, roughly doubling battery life. And by
disabling the channel "naming" feature, you get 120 memories instead of
80. Lastly, it has the "size factor" I want - thin enuf for shirt pocket
use.

Wow, you do have some problems! Well, first I'd like to say that your 80-meter test may be a bit harsh for judging your installation. Your RF resistance on that Outbacker when configured for 80-Meters is a small fraction of the 50-Ohms you might achieve after matching. In other words, the Outbacker is terribly ineffiecient on the lowest bands it resonates on, but so are Hamsticks, Spider's, Texas BugCatchers and all the rest of the short mobile vertical monopoles.

Your biggest installation problem with a multi-band mobile antenna like the Outbacker is not getting it to resonate on the various bands, but getting it matched for each band. The right way to go about it is to get your hands on something like the Lakeview Inducti-Match (same people that sell Hamsticks). It's a $10.00 coil that is designed for use with a 3/8 x 24 mount. It has a wire lead with an aligator clip on it that is used to create an L-Network. Let me back up a bit with some theory:

A loaded vertical, like the Outbacker, is loaded to compensate for the fact that when you shorten a vertical to less than 1/4 wavelength for the frequency at which you intend to resonate it, you introduce capacitive reactance. Even at 10-Meters, the Outbacker is less than 1/4 wavelength, so some inductive reactance (loading) must be designed in to compensate for the capacitive reactance. The loading basically lengthens the antenna electrically to make it a true 1/4 wave.

Every tap on your Outbacker applies the right amount of inductive loading to make the constant physical size of the antenna the right length electrically for each band. Fine tuning the length of the stinger completes the job of getting the antenna to resonate at a desired frequency for each band. Unfortunately, this is where too many operators end their tuning efforts.

The antenna impedance, the line impedance and the transmitter impedance must all match for maximum power transfer!

You really should match the antenna to the line at the antenna feedpoint. This is where the Lakeview Inducti-match comes into the picture.

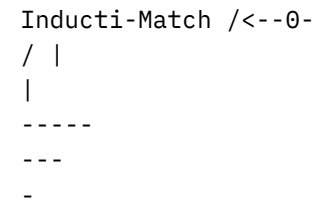
Your Outbacker looks like this without the match:

```
|
|
|
---|
| /
| /
Tap point -> -->/
on coil /
/
|
|
|
0--- Coax center-conductor

0--- Coax shield (to Ground)
|
|
-----
---
-
```

Your Outbacker with the Induct-Match installed:

```
|
|
|
---|
| /
| /
Tap point -> -->/
on coil /
/
|
|
|
/---0--- Coax center-conductor
/
Tap on the /
```



So what's happening here? This is called shunt-feed impedance matching. At 3.5Mhz, your Outbacker will show a load impedance of about 8 ohms instead of 50. This mismatch lessens on the higher bands. This is lost efficiency. You are resonant but you are generating more heat than RF!

Let's throw away all the formulas that I can't remember and understood only briefly, a long time ago, let's look at how to tune this thing by the seat of our pants. It's simple:

First you move your loading tap to a given band and adjust the stinger for maxiumum field strength at the desired frequency of operation. (Beg, borrow or buy a field strength meter and follow it's directions for use.) Your antenna is now resonant, independant of mismatch. Attempting to find resonance with an SWR meter is accurate ONLY when an impedance match of the entire system (trasnsmitter output impedance to line impedance to antenna load impedance) has already been achieved. This is so common, it's not funny, it's just pitiful! People detune the resonator from the true quarter-wave resonance position in an attempt to achieve the almighty 1:1 SWR without concern for impedance matching. Not only is efficiency down due to the mismatch, taking the antenna away from true resonance can result in undesirable hi-angle radiation patterns (killing the very strongest virtue of the 1/4-wave vertical.)

Next, use your SWR meter, at the feedpoint, to find a tap position on the Inducti-Match coil which adjusts for lowest VSWR.

Your antenna system is tuned for that band at that frequency.

Now determine the stinger positions (field strength meter) and tap points on the Inducti-Match (SWR meter) for each of the other bands at your chosen center-frequencies for each one.

Lastly, you must establish a terrific ground at the feedpoint. Ideally you want as much sheet metal as possible at the same elevation above the road as the feed point of the antenna. The curious thing I have observed is that this sheet metal, which establishes the mirror-image of the monopole, does not have to be under the feedpoint as viewed from the sky. It is much more important that it be at the same height as the feedpoint as viewed from the side!!! Use tinned, braided copper straps (like 1.5 inches wide --- I've seen it sheathed in rubber (great for avoiding corrosion) to attach the feedpoint ground to the body of the car. Use the same stuff to ground all large pieces of metal to each other... engine block to frame, exhaust system to frame, hatchback to frame, engine hood to frame, etc. Run the same stuff from transmitter chassis to frame. To combat noise, run 00 guage cables from your batter

posts to the rig's power cable. Yes, double-ought is huge stuff, and you have to taper it down to something like 12-guage at both ends, just to attach it to the battery and to the rig's power leads. I first read about this in Don Johnson's 40+5 years of HF Mobileering and thought it was ridiculous. But then I noticed something about my Kenwood TS-50S power cables. They are twice as wide (double 12-guage for both sides of the circuit) for most of their length, then they come down to only half as much conductor at the connectors. If power capacity was the issue, any electrician could tell you that stepping down the diameter of the conductor at both ends defeats the purpose of having a long run of larger diameter conductors. But amperage is not the issue. Noise is, and it seems the Kenwood engineers have seen the light too. The larger the diameter of your power leads (even when well in excess of the guage necessary to carry the number of amps being pulled) the less noise the leads tend to absorb and introduce into your transmitter's power supply.

It was a real bit__ putting these heavy cables in my car, but it has paid off. I have a very low noise ceiling. Other noise-cancelling techniques may be necessary, so do your reading. I've worn out my fingertips on this one. Good luck!

Dan, my 79A(D) works very well in the aviation band. In particular, the new broadband antenna supplied with the (D) works much better than the antenna supplied with the 78A I used to have.

The only thing I notice is that the audio on AM is louder than on FM. I guess that has something do do with the different detector involved.

You've no doubt got some RF in your shack. I too had the same such problems along with lots of static noise, 17 khz birdies from the TV upstairs, and RF in the headphones during transmit. I have my shack in the basement of my house, so I drilled a hole through the floor, drove a 3/4" diameter 7' long copper clad rod through the hole into the ground underneath, attached a 1" copper braid to it and grounded EVERYTHING GROUNDABLE including the case of the computer power supply. This cleared up all my problems and reduced tendency of hearing the stomping of feet on the floor above me. KI7RI

3385. ICOM 2GXAT Warning ....

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-29 00:00:00 UTC
From: glennmead@aol.com
Message-ID: <3nv19i$fh8@newsbf02.news.aol.com>
Source record: 218168

The antenna moint on my new 2GXAT had lost its support
screw located on the back of the radio. I called ICOM to get
the screw size. They acted like this has been a problem and
many have called in to get another screw. I asked if it was OK
to use until I got the screw replaced, and they said yes. 3 hrs
latter I could not raise the local repeater. Further investigation
uncovered that not only was the rear screw gone, but the nut
that goes around the mount had also loosened, and the result
was the antenna mount broke the two solder connections where
it mounts inside the radio. I was able to fix it after handcrafting
a tool to remove the nuts that hold the volume/squelch/channel
switches in. Fortunatly no radio damage.
note: the screw is 2mm x 3mm. Best match I could find to hold
me over until the replacement from ICOM comes was a 2mm x
5mm that was at Lowes Building Supply (of all places). The also
had a 2mm nut which could be used as a spacer to shorten the
screw. Cloodge - but I'm still ham'n.

>
I just bought a RS DSP box and I found it to be supprisingly good. On
my Icom 735 with 250 hz xtal filter the DSP unit was a little narrower
on the low side and rang a little worse than the 250 hrz. Not bad at
all. The noise reduction was not effective on the Icom.

Next I tried it on my HW 8 here the noise reduction was very good and
the filter improved the reciver but the opposite sideband was still
a problem.

The carrier suppression was better than the notch on the 735.

I had to put an aplifier in front of the dsp box on the HW8.

3391. Ham Station for Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-30 00:00:00 UTC
From: jay.serafin@n9csa.com
Message-ID: <950430180415731@n9csa.com>
Source record: 218097

I have the following ham gear for sale. The reason for the sale is that I have a severe back injury, and cannot sit at the station as much as I would like to. All equipment is functional and in very good working condition. Warranty against DOA. No other warranty is expressed or implied.

Kenwood TS-140S 10M-160M 100W transceiver. Has general coverage receiver. IF-232C computer interface included. Has Kenwood MC-80 desk microphone. Rig has less than 20 transmit hours total. Mainly used for the past 6 months as SWL receiver.

Features include AM/FM/SSB modes of operation, dual adjustable noise blankers, voice processor (built-in from factory), A/B VFO operation, 20 memories, scan capability, VOX, etc. Never used on CW, SSB/FM only.

Daiwa CNA-2002 cross-needle 2.5kW PEP automatic antenna tuner. Never has seen more than 100 watts through it. 2 antenna position switch, plus built-in 100W dummy load. Tunes in less than 30 seconds every time with as little as 5W drive! Dual "fine-tune" controls for when you move a little off of the "tuned" frequency.

Both items are in very good condition, physically and electronically. No operational problems encountered during time I have owned them.

Both items require a 13.8VDC supply.

Radio and tuner will be sold as a package only. $650 or best offer. Prefer to sell to local ham, so that person can see the system in operation, but will ship within the continental US for $15 extra.

Also, I have an Elenco 25A 13.8VDC continuous-duty power supply. This is a great power supply, and has powered the above-mentioned equipment without fail. Asking $75. Will add this to the above radio/tuner package for $70, plus $8 shipping.

Please feel free to contact me at jay.serafin@n9csa.com (my BBS) for more information, or negotiations.

Thanks for taking the time to read this ad.

Hi! I love my Kenwood 251-A, except for the fact that local pagers in my area wipe out some frequencies, and make some fairly local repeaters unusable. Can I get some sort of filter to get rid of some of this intermod? I don't need to get rid of it all, just cut it down significantly to let the repeaters through on a couple frequencies.

Thanks,
73
Chris.

3402. Help save 27.065 Mhz.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-30 00:00:00 UTC
From: rickcrider@aol.com
Message-ID: <3nvm69$j6k@newsbf02.news.aol.com>
Source record: 218173

I am a dedicated ham, an ARES volunteer, avid channel 9 monitor, and
work with the local police on volunteer basis. Some local 'rednecks'
on the CB (childrens band) have apparently chosen channel 12 (27.105Mhz)
as their home chat channel. They are obviously running MEGA watts and
are >completely< wiping out channel 9 with bleedover. Recently I turned
to channel 12 and explained the problem and asked them to 'please' choose
one of the other 38 channels available to play with their expensive and
illegal toys. One responded only to tell me what he thought my 'momma'
did for sexual pleasure. Well, I'm pissed off. The nearest FCC field
office told me that if I would provide them with a name, address and
possibly a recording of some of the offenses that they could 'maybe' help
out. Obviously they are not terribly interested in CB foxhunting.
Any ideas out there? Would love to see these linears converted to 1kw
boat anchors. Any bounty hunters out there $$$$? Thanks.

3403. County Hunting Software

CountyCAT v1.30 Released

CountyCAT is a small, easy to use database to aid county hunters in their quest for the CQ County hunters award. It will track your progress and help you with the messy paperwork that plagues all ham radio awards. CountyCAT is not a logging program, there are many good loggers on the market. It is a database designed to work alongside your favorite logger.

CountyCAT was written as a supplement to the logging program "Log-EQF" by Tom Dandrea, although it can supplement any logging program that allows you to shell to DOS, or another program. I wanted a program to help me with county hunting, but I didn't want to switch to a new logging system. I wrote CountyCAT so that I could shell from "Log-EQF" to check on a county then get back to logging. I think CountyCAT fills this need.

CountyCAT features:

* Database for County hunters going for their "First Time Around" award.

* Prints a state by state summary of worked vs unworked counties. Helpful for quickly tracking progress toward the different levels of county hunting awards.

* Will print a detailed report to printer or to text file. Suitable for submission for CQ County hunters award. (Registered users only)

CountyCAT is available for download from:
IBM-Net 1-317-882-5575
First time callers can download after callback verify.

CountyCAT is also available for anonymous FTP transfer from:
oak.oakland.edu
It is in the pub/msdos/hamradio/util directory.

Source record: 218175

Hello Mat,

>but would like to be assured by someone who knows...
>If I get a 79A(D) for my wife, will we still be able to
>use the "clone" function of the handheld?
I recently bought an TH79ED and the first thing I did after
expanding was cloning with my TH79E.
It all went fine, I noticed that on the new unit the
frequency is displayed, and the VFO range was less than on
the old unit on VHF and UHF, it now reflects the actual range
of the VCO's.
Another thing is very interesting, 2 ham's here have replaced
the microprocessor in their 'old' TH79E with a TH79ED version.
and it realy works! only to get everything working right you
have to preform the AM squelch mod and connect one pin of
the uP to a different supply line.

>Thanks.

3406. FT-51R: comments & question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-04-30 00:00:00 UTC
From: fh@ap-pc818c.physik.uni-karlsruhe.de
Message-ID: <3o04mp$blt@nz12.rz.uni-karlsruhe.de>
Source record: 218177

Hello there,

since a few days I'm a proud owner of a new handy, it's a Yaesu FT-51R.
The general impression (already discussed here before) is very positive:
small size, intuitive user-friendly interface... (as promised in the ads).

Besides that, I see two draw backs, which I would like to mention here:

1) I'm harldy missing a kind of "audio mix" feature (like the Kenwood and
Standard HTs have). For example, if I work in PR on 70cm, there seems
to be no chance to listen to sub-band receiver (either 2m or 70cm) with
the _internal_ speaker. :-(
Any way to realise this (maybe by an undocumented feature)???

2) The FT-51R has no DC power jack! Seems that the handy can only be DC
powered via the metal plates of an installed battery pack. I've heard
about a battery eliminator by W&W, but their products aren't available
here in Germany.
That's why I would like to build a kind of adaptor for charging and
powering purposes. Right now, I'm not sure weather I should modify
the included base stand (haven't got it's name in mind) or design a
complete new one.
Has anyone done something similar before? If so, are there any ex-
periences or recommendations? Also, I haven't found the assignment
(expression?) of the signals to the 4 contacts (on the bottom of the
handy) and the 4 metal plates (on the battery pack).

Pse xcuse my humble English. Mni tnx in advance de ... Frank from Germany.

PS: Did anyone modify a US version of the FT-51R for european purposes
(i.e. enable the 1750Hz burst tone)? If so, please drop me an EMail.

Glenn Mead (glennmead@aol.com) wrote:
: I am thinking about buying a Standard C5718DA. Any comments
: for or against would be welcome. Thanks.

I've had one for almost a year now. Generally, I like it, albeit I'm not real happy about the position of the PTT switch and the amount of force required to activate it.

Also, the first thing I did after buying it was to take it to work, and put it on our service monitor. The VHF was fine, but the UHF side was over-deviating. Also, I have had many comments about muffled/noisy transmissions, probably due to lack of a noise-cancelling microphone, and the deviation problem.

I have just begun to experience PLL unlock on UHF. I suspect that I might have thrown my VFO out of whack when I did the MARS/CAP/etc. mod.

Hope this helps.

-Steve

>reply. There were quite a few people talking 2 each other on other
>freqs. Is it a good practice to join them? (ie how do i talk to them?
>is there anything that i should do to tell them I want to join their
>conversation ?)

It seems most areas frown on calling CQ on a repeater. I understand parts of the argument against CQ on repeaters, but it can be confusing since CQ is standard practice everywhere else. If the repeater isn't being used and you want to establish contact with someone, drop your callsign followed by either a) nothing b) monitoring c) listening d) mobile if driving around in a vehicle. I usually just drop my call (KE4DPX) and leave it at that. Others typically use N9JCM MONITORING or N9JCM LISTENING.

If a conversation is in progress and you want to join in, wait for one of the gang to release the PTT then drop your callsign. Many repeaters send a courtesy tone (a beep, bell, or such) each time a person releases the PTT indicating that now is the time to drop your call. Courteous operators will leave about 15 or so seconds between transmissions to allow time for others to join in. Some folks that operate HF more than VHF/UHF key up almost the same instant the other person drops it, making it difficult to join in. A few guys in my area do this -- they are very nice folks but are more used to operating HF and forget to leave a space.

>I hear CW between conversations being transmitted in 2m. What is its
>exact use ?

This is typically the repeater identifying itself as per FCC rules and regulations. Usually every 9.5 minutes you'll hear either a voice identification (WELCOME TO THE W4BDC BARS CLUB REPEATER BROOKS K Y) or a CW identifier (W4BDC or W4BCD/R in CW).

>How do I contact using the repeater ?

Reference first paragraph.

>How can I find out the repeater freq in my area ?
>(I am in Wheaton,Illinois a suburb of Chicago zip code : 60187)

An easy way to do this is to get into a conversation and ask for a short list of repeaters in the area. Also pick up a copy of the ARRL Repeater Directory (about $6) available directly from the ARRL or in ham stores.

Hmmmm. Sounds like a problem I had with my old IC-02AT (about 3.5 years ago). The nut had loosened, and the solder connections had broken. Of course, back in those days things weren't quite so tight inside a rig, so I was able to just solder the contacts back and tighten up the nut. So far, in three years of owning my W2A, I haven't had any problem like this (in fact, no problems at all), but is this a common Icom problem?

x
The Radio Shack PRO-2035 Scanner:
How Does It Compare With the PRO-2006?

Copyright 1994, 1995 by Bob Parnass, AJ9S

[NOTES: An earlier version of this article was published in the author's Scanner Equipment column, Monitoring Times magazine, January 1995. This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

Radio Shack recently discontinued the PRO-2006, perhaps the best base/mobile scanner radio ever sold, and replaced it with the 1000 channel PRO-2035. Bob Grove reviewed the PRO-2035 in October 1994 Monitoring Times magazine. How does it stack up against the PRO-2006? Read on.

Background

In 1986, Radio Shack introduced the PRO-2004 wide band programmable scanner and it immediately captured the attention of hobbyists. The PRO-2004 was made by General Research Electronics and was different from other models of that era due to its large 300 channel capacity and nearly continuous frequency coverage of 25 to 1300 MHz. Key to the PRO-2004's superior performance over such a wide frequency range was the use of "up conversion," a design found in expensive commercial and military receivers.
The PRO-2004 was replaced by the PRO-2005 in 1989, which was upgraded to the PRO-2006 one year later. The PRO-2005 and PRO-2006 were manufactured using tiny surface mount components, and despite a different cabinet, display panel, and keypad, the PRO-2004 and PRO-2006 circuitry and features were very similar. The PRO-2006 scanned and searched faster and was more sensitive. Except for the use of a plastic case, the PRO-2006 was equal to, or better than the PRO-2004.
By 1993, the highly prized PRO-2006 was getting long in tooth. Uniden introduced the Bearcat 8500xlt, the first Bearcat scanner featuring up conversion and a tuning knob. Radio Shack's somewhat late response to the 8500xlt is the new PRO-2035.

The PRO-2035 analyzed in this review was purchased from a local Radio Shack store and bears a serial number near 3000.

Physical

The PRO-2035 is about 5/8" wider and 1/2" taller than the PRO-2006. Extra room in the spacious cabinet will interest experimenters and companies who may provide aftermarket accessories for the PRO-2035.
The dark plastic case has rounded corners, typical of contemporary "European" stying. The squelch and volume knobs are the same dark color as the front panel, and you can't see where they are set as Radio Shack opted not to paint the hairline marker grooves a contrasting color. You can paint a white groove in each knob using a small bottle of White Out correction fluid, a product intended for covering typing mistakes.
Although there is a jack for running the PRO-2035 from a 12 VDC source, Radio Shack refers to this model as a "home scanner."

Frequency Coverage

There is a typographical error on page 3 of the owner's manual which specifies that the PR0-2035 tunes the 470 - 805.750 MHz range. Coverage in this band actually stops at 520 MHz and resumes at 760 MHz. Despite the limits cited in the manual, the PRO-2035 tested for this article tuned 25 - 520, 760 - 823.995, 849.005 - 868.995, and 894.005 - 1300 MHz.
Lately, the most frequently posed scanner question on the Internet and computer bulletin boards is, "How can I modify my scanner to cover the cellular phone range?" The FCC no longer permits companies to sell scanners which cover the 800 MHz cellular phone frequencies or which can be easily modified to cover them. As sold in the USA, the PRO-2035 does not tune the cellular frequencies directly. This raises an interesting question for a product reviewer or scanner experimenter: If he or she finds an easy way to expand frequency coverage into the cellular phone band, should the information be published? Doing so could lead to a product recall.

Memory Features

The PRO-2006 has 400 conventional memory channels and 10 Monitor channels backed up by an ordinary 9 volt battery. The PRO-2035 has 1000 conventional memory channels and 100 Monitor channels backed up by a special 3 volt battery soldered onto the main circuit board. The owner's manual states memory contents will be retained for

up to 3 months in the event of a power interruption.
Both the PRO-2006 and PRO-2035 have 10 pairs of
search limits, but the PRO-2006 permitted searching only
one range at a time. The PRO-2035 is more flexible and
allows "linking" search ranges together sequentially. You
can set search range #1 limits to 46.61 - 46.97 MHz and
search range #2 to 49.61 - 49.97 MHz, for example, and the
PRO-2035 will alternate searching both ranges.
Here's a tip: If your favorite search range has one
or two birdies, or frequencies you want to skip, you can
break the range up into two or more sequential ranges and
link them together.
Not only are there a lot more channels in the PRO-
2035, but several new ways to manipulate them. By pressing
a few keys, you can:

1) zero all 100 memories in any single bank

2) zero all 1000 memories in all banks

3) zero all the locked out memories in any bank

4) display the number of "empty" channels in any bank. The PRO-2035
owner's manual refers to memories which contain 0.0000
as "empty" memories.

5) move all the nonempty channels in a bank downwards
to fill in the empty channels in the bank

6) transfer multiple Monitor channels into one or more banks

7) transfer all the channels in any bank into the Monitor channels

With so many channels, the PRO-2035 needs another
feature, but it's missing: it should skip over empty
channels automatically. Although the PRO-2035 scans twice
as fast as the PRO-2006, it still wastes time scanning
empty channels unless they are locked out. The bulk move
operations listed above clear the lockout on each
destination channel. Owners will certainly grow weary of
pressing the LOCKOUT and MANUAL keys for each empty
channel.
There are 10 banks of 100 channels each. Bank 1 is
for channels 1-100, bank 2 for 102-200, and so forth. This
is more difficult to use than the numbering convention
employed in the Icom R-7100, where bank 0 is for channels
0-99, bank 1 for channels 100-199, etc. With Icom's
numbering system, you can easily tell what bank a channel
is in by its first digit, e.g., that channel 650 is in bank
6. In the PRO-2035, channel 650 is in bank 7, and that's
confusing. All that aside, a better scheme would be to
have more banks and fewer channels per bank, say 50 banks
of 20 channels, or even user definable banks, because a

bank of 100 channels is really too large for sensible programming.

Almost 20 years ago, the Electra/Bearcat BC-250 incorporated a fantastic new feature termed "search and store." One could program a pair of frequency limits, start an automatic search, and store all active frequencies into a special scratchpad memory. The active frequencies could later be recalled and programmed into regular memory channels. Electra's scheme was elegant -- smart enough to store each active frequency once and only once. What's more, one could store unwanted frequencies, e.g., birdies and paging frequencies, into the scratchpad and they would be skipped during conventional searches. Today's Icom R-7100 receiver boasts a similar feature.

Scanner hobbyists were hoping Radio Shack would offer a search and store feature in its next premium scanner, and it did -- sort of. The PRO-2035 has an Auto Store mode which stores active frequencies found during a search into one or more conventional memory banks. Once all the empty channels are filled, the PRO-2035 emits a series of beeps and stops searching. There is a separate pair of frequency limits for Auto Store so you won't use up one of the 10 pairs mentioned earlier.

What a pity the Auto Store implementation is not all it could be. You cannot use it to skip unwanted frequencies. Worse, it will store the same frequencies over and over again into empty memory channels. Let's say you program the PRO-2035 auto store limits to search between 407 and 419 MHz, and specify that active frequencies will be stored in bank 4. You start the search and let it run while you run some errands, hoping that while you are away, the PRO-2035 will be catching dozens of interesting federal frequencies.

Upon returning, you find the PRO-2035 snared a busy Veteran's Administration hospital paging system and stored the same frequency in 30 channels! That's just what happened during the evaluation. Even with its limitations, the Auto Store mode is beneficial and a few new frequencies were found while using it.

Here's a tip not mentioned in the owner's manual -- you can use the Auto Store mode to intentionally store the same frequency in several channels. Set both the lower and upper auto store limits to be the same frequency, open the squelch, and start the auto store search. The PRO-2035 will chug along, storing your favorite police or other frequency in all the channels in the banks you selected.

The tests which follow were performed by switching an outdoor Antenna Specialists AV-801 antenna back and forth between a PRO-2006 and the PRO-2035.

Sensitivity

Spot checks were made to compare sensitivity by listening to the same weak signals on both scanners. Both radios were similarly sensitive except in three instances: the PRO-2035 was slightly more sensitive at 147 and 852 MHz and noticeable more sensitive at 460 MHz.
This could be splitting hairs, as my 10 year old Electra/Bearcat BC-300, an old design optimized for 4 bands, beat both Radio Shack models in the sensitivity department.

Dynamic Range

The PRO-2035 and PRO-2006 are high end models, and people who buy them are more apt to connect them to outdoor antennas. Therefore, it's important that they perform well in strong signal environments.
Perhaps the biggest performance difference between the PRO-2006 and our PRO-2035 became apparent when listening to weak signals in the presence of a strong station transmitting on another frequency. The PRO-2006 has much better dynamic range than the reviewer's PRO-2035. Using the PRO-2035, a moderately strong signal from the 460.525 MHz sheriff's repeater 10 miles distant wiped out weaker signals on frequencies 50 kHz in either direction and produced hiss on weak signals 100 kHz away. The desense phenomenon was a problem in the 155 MHz band, too. The PRO-2006 was not affected by these signals.
To explore the problem further, the PRO-2006 was replaced with a PRO-2005 and the tests run again. Neither the PRO-2005 nor PRO-2006 were desensitized by the moderately strong signals.

Images and Spurious Responses

The PRO-2004/5/6 series, the portable PRO-43, and the PRO-2035 use "up conversion," but the PRO-2035's 609.005 - 613.5 MHz first IF (intermediate frequency) is 2 MHz higher than the earlier models. We speculate the change was made to avoid interference problems which bothered some owners of the earlier scanners who lived near a channel 20 television transmitter. The TV signal mixes with one of the local oscillators and generated a third signal near 48.5 MHz, the 2nd IF, causing interference on several frequencies.
Although up conversion affords improved image rejection, triple conversion and frequency synthesis circuitry are complicated and several images were heard, especially on the PRO-2035.
On both the PRO-2006 and PRO-2035, images of paging transmitters were audible in the 159 - 162 MHz range. Analysis shows these signals to be 771.9975 MHz higher than

the displayed frequency. For example, the 931.5125 MHz KOR933 paging transmitter, located more than 7 miles away, was heard when the PRO-2035 was tuned to 159.515 MHz. A paging image hindered reception of a sheriff's repeater in the next county on 159.15 MHz. The same paging images were present but barely detectable on the PRO-2006. Another image, heard only by the PRO-2035, appeared on 146.075 MHz, and it was actually a 904.075 MHz data transmission.
The PRO-2035 received cellular phone images, reduced in strength, between 1105 and 1115 MHz. The difference between the actual and displayed frequencies varied:

PRO-2035 tuned to (Image)	Actual transmitted frequency (Actual)	Difference (Actual - Image)
1105.550	870.450	235.100
1107.875	876.120	231.755
1110.900	881.100	229.800
1113.470	886.530	226.940
1114.840	893.160	221.680

New Features

The new tuning knob has a light feel but is a welcome feature nonetheless. A look inside the PRO-2035 revealed the tuning knob is connected to a special switch assembly rather than an optical chopper, or photo interrupter, used in higher price radios and computer mice. The knob can be operated as a channel selector or as a VFO control. We discovered a technique, not mentioned in the owner's manual, which let's one enter a frequency and tune around without actually storing the frequency. To tune around 154.6 MHz, for example,

1) press MANUAL (if not already in the manual mode)
2) press 154.6
3) press TUNE
4) rotate the knob in either direction to begin tuning

If you have never used a scanner with a tuning knob, you will be pleasantly surprised how handy it is to be able to tune around using a knob instead of fighting with the up and down keys on the PRO-2006.
While putting the PRO-2035 through its paces, the tuning knob was used in the VFO mode to chase down and identify a spurious paging signal, a "spur," which was drifting up and down the 2 meter ham band. The spur caused a serious interference problem to three area repeaters. Chasing a wandering spur requires the use of a

tuning knob and the PRO-2035 served well. The PRO-2006 was virtually useless in this application.

Other Considerations

The PRO-2035 specifications state 50 channels per second as the fastest scanning speed. Our PRO-2035 scanned slightly faster than 50 channels per second in a bank loaded entirely with 800 MHz NFM frequencies, and slowed to 40 channels per second in a bank purposely loaded with a mixture of frequencies in different bands and modes.
Some scanner buffs refuse to use the priority feature on their radios because priority sampling tends to "chop up" transmissions on nonpriority channels. The priority feature in the PRO-2035 is well behaved in this regard, and one can hardly tell it's enabled.
While the squelch on the reviewer's PRO-2035 had an acceptable amount of hysteresis, some users may wish to reduce it. That is, decrease the amount of "play" in the squelch control. One could lessen the hysteresis by replacing the tiny 100 Kohm surface mount resistor between pins 12 and 14 of IC-2, a TK10420, with a 220K or 330K ohm resistor.
Wine gets better with age. That's not true with the EL (electroluminescent) panel used to backlight the displays in the PRO-2004, PRO-2005, and PRO-2006. The EL panel grows dim as it is used. To prolong its life, GRE replaced the dimmer switch in later production PRO-2006s with a switch used to turn off the back light.
Instead of an EL panel, the new PRO-2035 utilizes LEDs (light emitting diodes) to illuminate the display, and that's an improvement. Unless overdriven, LEDs will work reliably for a very long time.

Summary

Being at the top of the Radio Shack scanner line, we expect a lot from from the PRO-2035. Its tuning knob and memory manipulation features are significant advantages over the PRO-2006. The discontinued PRO-2006 exhibited better dynamic range and fewer images and remains an excellent performer.
The PRO-2035 is a very good scanner. With a few changes, it could be a great scanner.
After this review was written, Uniden introduced the BC9000XLT top line base model, which the author tested and prefers to the PRO-2035. See the BC9000XLT review in Monitoring Times, March 1995 for more information.

3425. Warning - Kenwood Front Panel Kits for mobiles

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-01 00:00:00 UTC
From: rodell@netcom.com
Message-ID: <rodellD7wKrr.6Ln@netcom.com>
Source record: 218108

For all of you who might be considering buying a front panel kit from Kenwood for your 733 or 742/942 mobile, please note:

Part numbers with a 'B' suffix will work only on the 733. Most dealers are unaware of this fact.

For example, the 7 meter kit, the DFK-7 works on the 742/942, and the DFK-7B works only on the 733. The same is true for the other (-3, -4) kits.

Also, if you intend to split the front panel in a 742/942 series, you need the -4 (or -7) and the -3. The -3 contains another cable.

[Article crossposted from rec.radio.amateur.antenna]
[Author was George L. Hiscox]
[Posted on Mon, 1 May 1995 01:00:13 GMT]

Thanks for reading this.

I just came into possession of a Raytheon remotely controlled tuner for tuning a single wire antenna. I don't see a model number on it, but it is described as follows:

It is contained in a white metal box with approximate dimensions 9"X 12"X 4" deep. The box has a white plastic cover which is held in place by four snap fasterers, two on each side of the face. "Raytheon" is stenciled on the front cover. There is a ceramic insulator on the top right where the wire antenna connects to the unit. There is also a female coax connector on top of the housing about 3" from the ceramic insulator. There is a female (SO-239) coax cable connector on the bottom of the unit along with a ground lug. Also on the bottom is a grommeted hole where the control cable goes inside.

Immediately inside the control cable hole there are two terminal strips, each with four screw terminals. The terminal strips have labels "TB1" and "TB2." Both of these are located one above the other at the lower left-hand corner of the inner chassis.

Above the terminal strips is a 3PDT relay. Above that is a subassambly with eleven variable capacitors. Mounted vertically to the right of the terminal strips, relay and capacitor subassembly is a motor driven rotary switch. The capacitors and the rotary switch has a number of wires coming off them with numbered tabs. There is a toggle switch labeled "TX KEY OFF ON" mounted on the bottom of the rotary switch next to the motor.

To the far right of the box there are two Air-dux like coils. The longer of the two coils is approximately 1.5" diameter and 5" long. It is L1. There is a smaller coil mounted on a piece of plastic at a right angle to the longer coil. It measures approximately 1.25" diameter by 2.25" and it is L2.

I would appreciate any help in identifying the unit, it's model number and capabilities. Does anyone out there have any docs on it? Would happily pay copying costs.

Thanks very much!

George L. Hiscox	Very funny Scotty...Now
ghiscox@netcom.com	beam down my clothes!!!

3430. SABA Konstanz Stereo: Info Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-01 00:00:00 UTC
From: xopher@ot.com
Message-ID: <3o1gbp$6t1@oasis.ot.com>
Source record: 218113

If anyone has any info on this radio or its manufacturer, or of other
sources of info on collectible radios, please let me know!
This model appears to have been made for sale in W. Germany. All controls
are
labeled in German.

Mfgr: SABA (W. Germany)
Model: Konstanz Stereo
Bands: SW/AM/FM, push-button select
Chassis: Mainly tubes, some transistors
Speakers: built-in, large magnets
Tuning dial: very large, backlit, many names of SW stations, "Euro-band",
87-104 Mhz FM band, separate knob & pointer for FM;
glowing bar vacuum tube tuning indicator
Cabinet: Large, wooden (cherry?), mirror finished
Antennas: internal for all bands
Power supply: 120v/240v switchable
Documentation: detailed schematic with alignment instructions, warranty
tacked inside cabinet at factory
Condition: very good, except for minor scratches & missing back cover.
Age: late '60s or early '70s?

In it's time, it must have been quite an expensive unit. The cabinet is
solid wood, finished like a fine musical instrument. If Mercedes built
table radios, this would be it.The sound quality & tuner performance beats
many modern stereos. Although I really would like to keep it, any offers to
purchase are welcome.

>Brad

Unmodify it? Why bother? If your an amateur(Which the radio would be used for if it was not modified)
you are legally allowed to posess a modified rig as long as it is operated on the frequencies you are
liscensed for as a ham. RE: the Fcc's Homebrew policy....
If you really wanna do it, however, look behind the display board for a disconnected jumper. I'm pretty
sure this is where the mod is done. I'm not sure what the value is, but try a potentiometer or a resistance sub
titutor. I dont think that'll hurt it, it's just a 2950. Just fool with it until you find the right value.
If I was in your position, I'd just leave it the way it is.....rather than risking messing up the poor radio.
After all, those things were just about made to be modified!

Hi, I have the following for sale:

Swan Cygnet 270B Transceiver
- The radio works great, but it needs some tubes replaced to bring
it back up to full output power. Includes manual and hand mic.

Heathkit HM-2140 dual HF wattmeter
- Includes manual and AC adapter.

10-mtr. dipole antenna (homebrew)

Misc. amateur radio magazines (73, CQ, etc.) and test boooks.

$250 or best offer gets it. I would rather like to sell the whole thing
than rather piece it out. I would be extremely interested in trading
for a Atari Jaguar, or a Commodore 128D. If you have any questions, feel
free to e-mail me. Thanks for looking!

Due to it's (very) small scope, I would also say that this isn't a good
idea. Perhaps a maillist could better serve this focus.

>
First, there is no bitterness towards RS. What I said represents unbiased observations from having worked at RS for over five years and visiting their stores on a periodic basis and looking at their products. I still buy little stuff there but will never buy anything major from them in the future. I did buy a Sensation computer there because it was made in the U.S. and the quality was good. However, their support was terrible. If I was full of bitterness, I would have not bought the computer.

Anyone reading the Usenet posts can see that RS has quality problems. Look at the number of posts that talk about how happy RS owners are because they bought a TSP. The post talk about how many times they had to return the RS handhelds. First, the HTs should work right the first time. If there is a problem, it should be fixed right the first time. There should be no need to return it over and over and over again for repairs. Even Consumer Reports warns people that these service contracts are a rip off. However, because of quality problems with the RS stuff, you seem to need one. This is ridiculous! That is my objection to the RS stuff. Korean made products contribute to RS's problem with quality.

If you want to ignore the poor quality of their products and continue buying there, fine. You can lead a horse to water but you can't make him drink.

As for high turnover in retail in general, I don't agree. Most of the turnover is due to people being fired, not quitting. Most ham stores that I deal with have had the same people there for years. Even when I left the Shack, I still was in retailing. The people at that chain of stores worked there for years. Even the kids working there through school stayed there for years. If RS treated the people with fairness and respect, they would stay at the Shack for years.

Managers would also stay if they had fair compensation plans, but that is another story I can discuss at length.

Not to get off the subject, if you want a good radio, buy from the big FOUR..Kenwood, Icom, Yaesu and American Made Ten-Tec.

Regards,

Duffy

Hi,

I would like to purchase a dual band transceiver and have narrowed my choice down to either the Yaesu FT-51R or the Kenwood TH-79AD. According to the specs and things I've heard, they are near identical as far as features and quality. Although I understand the Yaesu has a lighted keypad, but the Kenwood accessories are cheaper. I would really appreciate any tips or comments from owners of both units, or even people who have read reviews.

Thank you very much for the info and advice. Feel free to email me directly if you'd like.

Sincerely,

Hiran

Small, small, small! Comes with drop in charger (slow 15 hour kind) with plug-in transformer, antenna. Original box and manual available (but there will be a delay; I'm in college in RI and they're at home in IL until the summer). Has 110-180 RX with AM enabled 110-137. Not used much except as weather and emergency radio but it does work quite nicely. Only reason I'm selling it is because the three repeaters I'm working on now are all 440 and I need money (student budget not condusive to amateur spending habits).

Asking $180. Please email Scott_Swanson@brown.edu if you're interested. If you can get to Brown U. campus I'd be more than happy to let you play with it before purchasing.

Hello All!

Hi guys!

I am a Radio Amatueur for a short time my license came a month ago so I'm
still a little wet behind the ears. What I would like is some advice to buy mi
first equipment.
I need a 2m Mobile Transceiver. I saw Alinco / yaesu / Azden & KenWood.
Which one of those is the best?
What I'm looking for is:

- 2mt Tranceiver
- Rx: 118-180 Mhz (more or less)
- Tx: 144-180 Mhz (more or less also)
- computer controlled
- 50W max output
- Easy interface with pakcet at 9600 bauds.
- Tone Encoder/Decoder included.
- DTMF Codes Included

Maybe half of the things I said were wrong. Don't mind me I'm just a Novice
Radio Amateur.

thanks in advance

Pedro

Interesting approach. Question: Do you build in a voltage regulator in the alkaline battery case? I would expect 13.8VDC to be too high for the radio as it's designed for 9.6VDC.

3452. FT-530 filtered cord. V. Limiting??

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-01 00:00:00 UTC
From: harrisok@vax.sonoma.edu
Message-ID: <1995May1.221452.1@vax.sonoma.edu>
Source record: 218135

Does anyone know if the Yaesu E-DC-5B filtered cig. adapter (FT-530) power cord has some sort of voltage limiting? I have this adapter and took it apart expecting to see some sort of inductor inards but found 2 transistors, 5 or 6 capacitors and a resistor. I remember hearing about people here who have gotten just the cord and the plug (no filter) and have used it in their car (I suppose) with good results.

Since I already have the filtered cord, I was going to continue to use it in the car. I have a friend who has ordered a couple of plain cords and plugs from HRO (one for me at home) for use from his car. Is this advisable? The HRO salesman did quite a song and dance regarding protection from voltage transients, etc., with the filtered cord.

My real question is: Is the filtered cord capable of voltage limiting or is it just more than is really needed?

Thanks,
Ken

> I would like to put one in each car on the same number. Has anyone out
> there
> cloned a cell phone before ??? please send email to RRives@aol.com

I think that might be illegal. The problem being is that the two phones *could* be used simultaneously on the same area cellular network. If that happened, the cellular service provider would assume that one of the users had stolen your codes and was using your account illegally.

I suppose since you plan to be in only one car at a time, this would not actually be a problem for you in practice but because the potential for illegal use by an unauthorized party does exist, I'm sure your cellular carrier would disallow it.

Hope I'm wrong. If I am, please post your findings. I'd like to buy a different phone but the activate charges are ridiculous. I'd simply program the new phone and erase the memory on the first phone. They'd never know. That's probably illegal too. Too many laws.

From: walt@lfs.loral.com
Message-ID: <3o35cf$14t8@watnews1.watson.ibm.com>
Source record: 218141

I've currently got an aviation antenna on my bird wired to a jack in the panel. I've a male plug for the jack coaxed to a BNC which I put on the aviation band HT for Air Traffic Control communications. The aviation bands are 118-136 MHz, so I'm thinking that this is close 'nuff to 144-148 MHz to be useable for a 2 meter HT. Recognizing that the SWR will not be very good, I would use a 5 watt HT, and also recognize that I've got one darned tall antenna (aircraft in the air!).

Will this work or will I need an antenna tuner inbetween? Advice please.

Does anyone know:

Is there anyone out there who can put all my cellular phones on the same phone number? I would like to put two mobiles, and two handhelds on the same phone number. One mobile and one handheld are very, very seldom used. Just want these in my other car, and in my wife's purse. One portable and one mobile will be used regularly by me, but I want the power of the mobile while I am in the car, but want the handheld while not in the car.

If I can't do this, I'd like to at least take one of the phones, a Motorola flip phone, and get it usable with credit card calls and with *999 calls. Right now, it says there is a problem with service. I know this works, because a phone I previously had was able to work like this, even without a working phone number.

Yes and no. There is a receiver that uses the PC as a user interface. The receiver is a featureless box that attaches to a card in your PC. All user controls and interaction is via a GUI on the PC. Works pretty well. Don't remember the name of the receiver, but it's available from shortwave dealers.

>Chris, N7RME

Yes, I think that I would have to put some sort of regulator circuit
in the battery case. However, the Yaesu specs for the FT-11R say that
you can use up to 12 volts for a power supply. I think I would be
concerned about heat, though. The FT-11R manual cautions against
"long" transmissions using the 9.6 volt battery pack and the resulting
heat build-up. The HT will automatically switch to low power output
from 5 watts if it gets too hot.

Although I have never measured the SWR of an aircraft antenna at 2m
frequencies, my guess is that it won't be too awful. HT's have to be
pretty tolerant of high SWR anyway because the impedance of a rubber
duck varies considerably depending on whether it's in free air, on
your belt right against your body, etc. I've had very good results
with 1.5w to a rubber duck from a plane. 5w to a permanent antenna,
even tho' it's off resonance, should work great.

You can get a copy of the The Log Ranger (mentioned in the May '95 issue of QST) from the Sensible Solutions BBS.

The telephone number is (908) 787-2982, available 24 hours.

The program is fully functional (not shareware), and is free of charge!

3484. Problem with Kenwood TH22AT

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-02 00:00:00 UTC
From: ezrg_ltd@uhura.cc.rochester.edu
Message-ID: <1995May2.180436.2044@galileo.cc.rochester.edu>
Source record: 218071

I have been having a small problem with my Kenwood TH22AT and was wondering if anyone else had been experiencing the same and/or knew of a fix. If the radio is on when the battery runs dead, it erases all of the saved memory chanels. This only occurs when the battery runs dead, and not when the radio looses power abruptly (i.e. radio shuts off temporarily when the battery is too low to tx).

Any help would be apreciated,
Ezra Gold

Marcin Roycewicz (u39237@uicvm.edu) wrote:
> I am looking for any modifications for an Icom IC-2GAT
> for ex. : opening aircraft AM receive and expanded RX/TX

The 2GAT does not receive aircraft, nor does it do AM

Depending on the serial number, there are several solder pads that
need a diode attached to them (one diode does expanded TX
138-174).

This was gleaned from the net, use at your own risk:

RE:----------

OUT-OF-BAND TRANSMIT MOD FOR ICOM IC-2GAT HANDHELD 2M TRANSCEIVER

Back side of display board:

```
_____________________________________
I D505 \
I D507 D504 ___ \
I ___ ___ I___I \ I
I I___I I___I \ -- + --
I D506 Q506 . . I I
I _o_------ _o_ \J I hole for
I I___I I I___I \. I on/off-vol
I o o I o o I control
I I I I__________________
I -----K---------- I
I add diode: 1N914 or equiv. I
I I
```

Connect diode between top lead of D506 and lower right lead of
Q506 as shown.

A surface mount diode may be added right of Q506 at \J. note that the
.___. are the same trace, while above the J is the center pole.o

```
. Note that this diode is 1906-0336, "-" at bottom, both "+" at top.
___|___
^ ^
| |
. .
```

Notes: D506 may be absent. If not, remove it.
Reset CPU if needed.

A friend did this and his IC-2GAT can now transmit 138 to 178 MHz (no

RF power output measurements were made). He did no retuning, and did
not have to reset the CPU. He used a tiny axial-lead glass diode,
replaced its leads with wire-wrap wire, and encased it in shrink-tube.
The operation requires a super-tiny soldering iron. Observe CMOS
soldering precautions: Unplug the iron and ground the tip before
touching the circuit.

The 2GAT mod is really...
Remove D 504 which is orginally a 1SS196 and replace it with a 1SS184
which is a dual diode. The service manual componet symbol shows the dual
diode but lists the 196.

More information on the IC-2GAT.

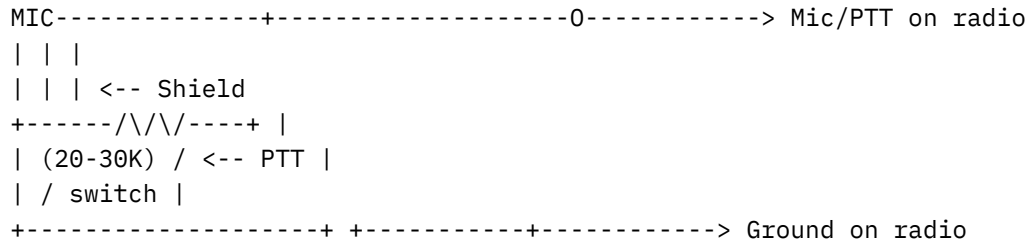
To RESET the CPU (and wipe out memory), hold the LIGHT button AND the
FUNCTION button while CPU is on, then turn it off, wait a second, and
turn it back on. Continue holding the buttons while all the LCD segments
display until "46.01" shows (about 1-2 seconds). This puts the radio
into 5/10/15/20/25 khz step mode. Its starts in 15 khz steps and other
steps in the list may be chosen. I wish 30 khz were in the list.

The instructions for the IC-2GE are similar except that you hold down
LIGHT and the WR button on top right next to the power switch. The
IC-2GAT also performs this same reset, and also enters the 12.5/25 khz
step mode. The step starts at 25 khz. When it is set to 12.5 (the only
other choice until you reset the CPU the first way) you can dial up
frequencies like 146.0125 which shows like "46.0125" where the "25"
are BOTH smaller digits. The "5" never shows in the "American mode".
The display goes to "46.01" in the "American mode" and to "46.00" in
the European mode.

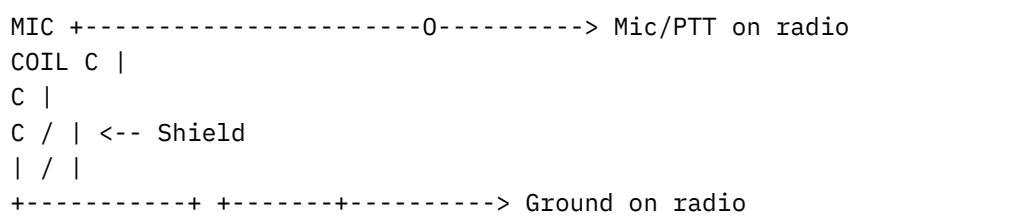
Another curiosity is that when I RESET my CPU, I did so while it was
tuned to 162.55 (weather). When I turned the power back on, EVERY segment
was displayed, but the radio was actually receiving 162.55 anyway. Then
when the reset finally took effect, the display went to "46.01" and
the weather signal was lost. I also notice that sometimes, the "U" for
synthesizer unlock (in the 10's position of the memory number) shows up
just at the moment the "46.01" or "46.00" does, then ends in a second.
I guess the sythesizer is being reset as well.

--Phil howard-- <phil@ux1.cso.uiuc.edu>
For those of you who are trying to interface something to a rig
which has a single two-conductor plug for both microphone input
and push-to-talk connections, such as many of the handheld rigs
including the Icom IC-2AT and IC-02AT, here are three circuits
that may be useful to you:

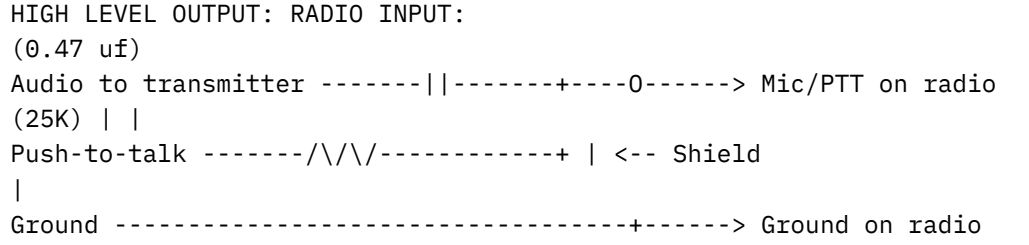
::: Electret condenser microphone to radio:
Radio Shack #270-092 mic element?



::: Dynamic microphone to radio:

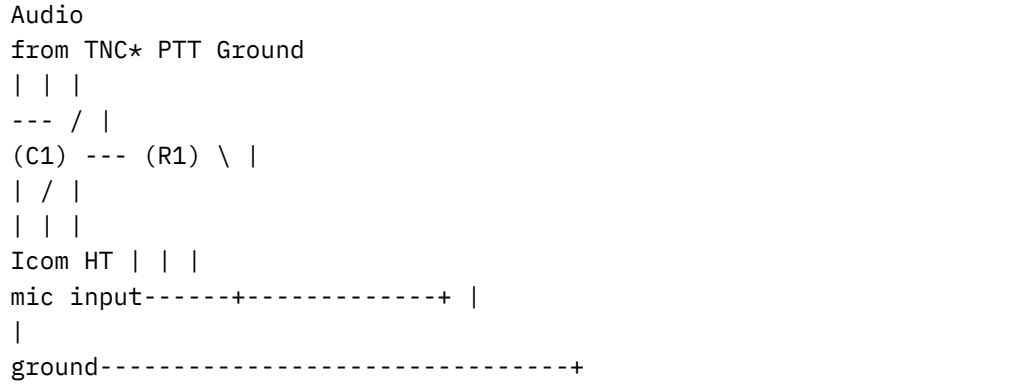


::: High-level input (such as from tape recorder, RTTY AFSK generator,
or Packet TNC output) to radio:



Subject: Hints On Interfacing To Radios
Newsgroups: rec.ham-radio,rec.ham-radio.packet
Keywords: HT's, packet, RTTY, microphones

/***** hpfclj:net.ham-radio / ky2d-2!ka2ugq / 12:08 pm Jan 26, 1986*/
I made a big mistake in the previously-posted schematic of
the connection between an Icom IC-2A, 2AT, or 02AT and a
packet radio TNC, RTTY afsk unit, or another microphone.
The resistor and capacitor were backwards. The correct
schematic follows:



C1 - 0.47 uf capacitor
R1 - 25K resistor

* TNC or RTTY afsk or another microphone or whatever you are
interfacing to your Icom HT.

Hi, I have been reading this news group for about 5 years now but this
is my first post. Sorry if anything gets screwed up with the post.

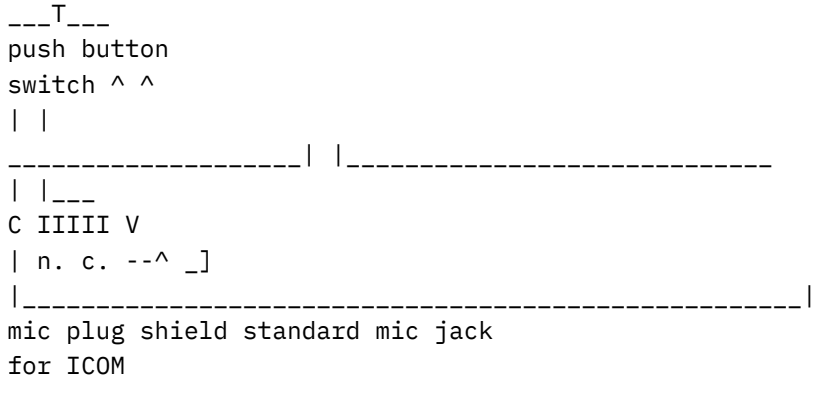
First, I would like to say thanks to all the knowledgable people who
have shared their experiences (the list of names is to long). Please
keep up the GOOD work !!

As to the ICOM question of PPTs.

I have just finished installing an ICOM in my RANS S-10 with PTTs on the
throttle with a Sigtronics intercom.

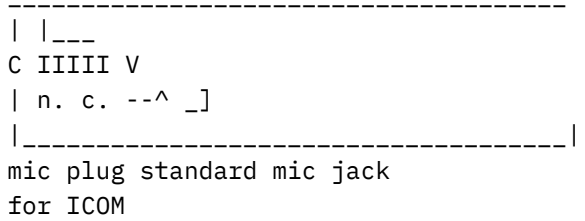
This is how I made every thing play together. Sorry for the poor graphics.

ICOM mic plug tip to one side of a normally open push button switch. Other side of switch to middle ring of a standard mic jack. Carry the shield straight from the mic plug sleve to the standard mic jack sleve. Now you can plug either a headset mic or the mic plug from the Sigtronic intercom into it.



OR

ICOM mic plug tip to the middle ring of a standard mic jack. Carry the shield straight from the mic plug sleve to the standard mic jack sleve. Now you can put a DC PPT in the standard mic jack and then put either a headset mic or the mic plug from the Sigtronic intercom into the PPT mic jack. NOTE that if you plug a mic or the intercom mic plug into this it will key the ICOM.



Standard aircraft radios use the tip to shield to key the transmitter, the ICOM does NOT use this method.

David Clock PPT switch switches BOTH the mic lead AND the tx key lead, I think some others do as well.

Jim Needham N201S work-617-981-2535

When I wanted to do this, I started out by making two simple straight through adapters, one for the mic and one for the phone. Then I measured all combinations trying to figure out how ICOM did thier trick. I accidently shorted the mic tip to shield and the tx LCD lit. I also pluged a mic from a headset and noticed that the tx keyed, and having another radio on the bench, heard the feedback.

ICOM mic jack, only 2 conductor
tip to shield, about 4 or 5 volts
phone jack
rx, audio from tip to shield

tx, same DC as above from tip to shield

My installation does work. In the air, on the ground, upside down B-{)###
I have also talked to someone else in my plane from another ICOM and it
sonded good to me.

Hope you have the same good luck that I have had. Stay out of the trees.

Jim Needham N201S work 617-981-2535

No problem getting Delhi parts and sections. I don't know the US distributor, but call up Delhi at 519 582 0710 (Ontario). You should look at your sections to find out the model. I would presume you have a DMX type with tapered sections and X braces riveted. Take a look at the X braces, they are stamped with a part number DMX-xxx-x. To find out which sections you have, look on the inside of the legs, about a foot down from the top. The section is marked DMX-108, for instance. You can get a hardware kit for the tower which has all the nuts and bolts. I have been told that it is unwise to use hardware store bolts. The Delhi bolts have a shoulder to take up the slack in the holes and prevent movement which would elongate the holes over time (besides being heat treated and galvanized). Price for a 68 footer kit is about $40 US and a base legs kit about the same.
Nice towers, almost a Canadian standard.

>Hiran

I have the Yaesu. I had the same problem deciding that you are having.
The reason I chose the Yaesu was it had a wider recieve. Now there is one
more reason. The cloning feature. Why? Because because of this design,
some resourceful person came up with software to program it. Now instead
of spending an hour and a half programming in all the freqs and alpha
display it takes about 30 seconds via computer. Since I travel on the job
this is great. I have my Detroit file, L.A. file and Chicago file. Plug
in the cable and download the city of your choice into the radio. You may
also upload from the radio too.
]

Just an added thought to consider. It's only $39.95 for the software and
cable.

In the latest QST, there's an article about Solar-powered QRP work for field day, and they mention a cool-sounding QRP rig from a company called Index Labs or some such. Synthesized, 10-160m, digital display, SSB/CW/(AM?), 5-7 watts output. They didn't list any other information about this rig, especially price. (1) Does anyone know how much the radio sells for, and (2) is it actually a decent rig? Any other information would be appreciated.

David--

You really should be careful about writing posts that encourage other
people to do things that are obviously illegal. As many people's
mothers told them, "Two wrongs to make it right." Besides, how would
you feel if the person you told to go vandalize someone's coax ended
up getting a bullet in the head? I'd guess not too good...

I picked one up at Dayton ($250!), so havent figured it all out yet.
However, you are correct about receive. When hitting the band switch, it
goes from 2 meters, to 350 MHz, to 440 Mhz, to 800 Mhz. It seems to tune
everywhere in between (except cellular).
The manual is terrible, almost incomprehensible Japanese English. They
even talk about "sprit" frequency operation in several places.

If anyone else has one, I'd like to hear from them, and find out what
they've learned about operating the radio.

Folks,

The recent talk on Yaesu FT-51R cloning port and software
prompts me to ask, does the FT-530 have similar capabilities?
I've not seen anything in the mods file, and the manual makes no
mention of cloning, BUT there is a clone output marked in the
schematic (it's the middle terminal of the speaker out jack.)
Does anone know about cloning or PC download capabilities for
the FT530?

Have you tried the toll-free phone number for Motorola's Parts Department??
1-800-422-4210. They can take your order and ship it the same day.

Just wondering if anyone out there has a good source they can recommend for the mating connector that is on the end of my Yaesu FT-5100. This is the power connector which has two spade lugs inside it, with one at a right angle to the other one.
I also have the same power connector on my Kenwood TM-3530A mobile rig. I have checked the local electronics store, auto parts stores, and even Radio Shack, but none of them have it. I thought these connectors were common automotive type power connectors, but can't seem to find them anywhere. Any and all help is appreciated.

>QST in May has an article by Lauren Rudd, KD8PZ titled "Let Your PC Do
>the Logging". The article reviewed many of the "popular" logging
>programs for both Windows and DOS formats.

>Unfortunately, left out was the one that I find the most useful. It
>is QLOG by Antonio Pinto IK5HGL. It normally runs under the DOS
>environment but of course can run as a DOS program under windows.

Another logging program left out by the QST article was Hamlog 3.1 by
Robin Gandevia VK2VN. It should also be available via ftp from
oak.oakland.edu. This is a real nice, easy to use logger that offers
all of the standard features offered by others as well as multiple
databases, contest logging, and a large text file area for notes that
can be tagged by callsign and attached to the qso for later viewing.
Even has some foreign language support when working foreign stations.
This is not an ad for this product just comments from a satisfied
registered user. Maybe QST should do a "part2" of the logging program
article in a future issue.

Source record: 218090

In this day and age of threaded news readers I don't really think that we need a new news group for amateur radio. Using the tools that we have to the maximum ability I think is the key. Simply start a new thread in rec.radio.amateur.antenna. I don't see any problems with this approch and it would save a lot of time and effort on system admin's who are lazy.

I have also read a lot about the *.qrp group, would this approch work for that as well? Please feel free to send me comments in mail or in the group. I still feel that with the flood of dos users from aol, compuserv, prodigy, and others still have not devloped the skills needed to use the net to it's fullest. The talk about a new group would be my evidence of this.

Thanks for reading...

Sorry Dave, but low_profile still makes me think of small, short radios.
Not low impact operating. There is also the '/', I'm not certain it's
allowed in group names, at least I couldn't find any current use of it.
I still think that qrp or qrp_something_else would work better. Let's see

rec.radio.amateur.qrp I think this has been voted down
before, but I don't understand why
.low_profile I don't think it tells the 'story'
.qrp_low_profile As above
.qrp_hidden Just thought of this one
don't know how good it would
really be, but it could cover
qrp, fox-hunts and 'low_profile'

>Any ideas out there? Would love to see these linears converted to 1kw
>boat anchors. Any bounty hunters out there $$$$? Thanks.
>

Well, If they continue you can certainly take it upon yourself to try and
locate them yourself. Consult the ARRL handbook if you would like to
build yourself a direction loop, or other devices. I believe AES sells
a 10 meter loop for a car and it could easily be tuned down to 11 meters.
Once you have found them, note the address and log various times of
operation and tape them would not be out of the question. Do not aproach
them even if they see you. Things could quickly get out of hand and you
could easily get in over your head.
Chances are that you will get your information off to the FCC and that is
where it will end. Unless there is several complaints the FCC will not
find it serious enough to warrant a field visit. I wish I could offer
more but you may find that you can get several hams in the area to help
you in your df'ing and help you with your report. And who knows you
might actually get the FCC to check the next time they are in the area.
Good Luck

: I have the Yaesu. I had the same problem deciding that you are having.
: The reason I chose the Yaesu was it had a wider recieve. Now there is one
: more reason. The cloning feature. Why? Because because of this design,

Well, take a closer look at the Kenwood; it has a cloning feature as
well. I haven't tried it, however, you don't NEED a cable to do it -- it
uses tones to transfer the memory. I got my HT yesterday and I love it.
It is small, has advanced features, and the antenna doesn't seem half bad
(the deluxe version). IT'd recommend it in a heartbeat
.

Careful, Dave. This can be deadly advice when you don't know the person you're dealing with. Besides, a much less destructive method was published a number of years ago, I think in 73. Basically, it was a construction article of a two-transsistor oscillator circuit that would rapidly and continuously sweep the Citizens Band with a noise-modulated carrier.

According to the author, a (standard) 9 volt battery would power the thing for about a week, so I suspect an alkiline might last two or three. Of course, the idea was to attach a quarter wave of magnet wire, then lean back and chunk it into a tree near the offending antenna. The power level was low enough to have minimal effect a reasonable distance away, so you could pretty well target your opponent this way.

I've wished for years that I still had that article <g>.

: the audio quality from this mic is not as good as from the built in mic.
: Can anything be done about it?

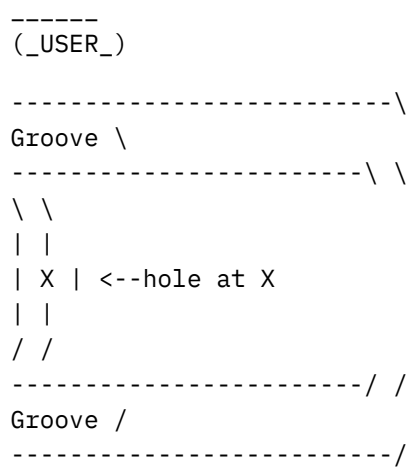
: I recall someone mentioning the idea of drilling a hole in mic but
: I am not sure if it was a serious proposal or if he was joking!

No, he was not - in a brilliant example of Murphy's Law, on many of the display mics there is NO HOLE for the microphone, so the sound of your voice has to pass through something on the order of a millimeter of solid plastic.

The "modification" requires drilling a very small hole thru the front of the case to the microphone. Proceed as follows:

Take the microphone apart (don't want to drill into the mic element!)

See where the mic element sits. Look at the front of the case. The point at the far right of the top molded grooves, under the USER button is where the hole needs to go:



When you open up the mic, you'll see what I mean.

I used a very small drill bit, twisting it by HAND. It only took a few seconds to cut thru the plastic. Another option might be to use a hot needle if you don't have a small enough drill bit handy.

Yes siree, this is a KILLER radio. Covers 440 (maybe lower) to 500 MHz, center tuned for 460 MHz but can be changed. This radio is KEYPAD Programabble! Yes! from offset, to transmit PL to recieve PL to offset to Channel lockout. Yes, you can transmit lockout single channels. This radio was bench tested, and is .4 Watts low power, and 5.6 watts High. It comes with a 1100 MAh battery, so Low power will last you till the end of time, and high power will last a good day of on/off talking. It also comes with a no longer made CM-35 1 hour professional Drop Charger, a stubby antenna, and a stock whip antenna, plus a BNC to TNC connector (the connection is TNC.) This radio has FULL DTMF! (1234567890*# PLUS the "other 4", ABCD). This is a killer radio I hate to sell, but well.. have to. Asking $500 / bo. Again, SERIOUS INQUIRES ONLY PLEASE. If you think $500 is too high, don't e-mail me to tell me that. If you think $500 is too high, but will offer $475, E-MAIL ME! Prosacuters will be violated.

Yup, have one of the first ones made. Bought it last year after seeing it at Dayton. Rig sells for $595 (not including shipping). Yes, it is a very good rig. Demand is very high and they are having trouble making them fast enough. May have to wait four months from the time of order to the time of receipt. Index Laboratories is located in Gig Harbour, Washington. Sorry, I am at work and don't have the number. They have advertised in CQ at times over the past 12 months.

This rig is really built solid. Try it, you'll like it if you are into QRP.

I have accomplished all of the "mechanical" aspects of converting a VHF GE MASTR II to repeater use. Nothing in particular has been done to shield or separate the TX and RX and the former is speaking to (desensing) the latter. Can anyone recommend a reference that deals with additional shielding that will isolate the TX and RX? Thanks.

Glen,

Many times a customer calls a company, tells of a problem he has had with a product and the CSR
says he has seen that before. Now what the customer did not find out is that just maybe there
have been 3 or 4 times the trouble has happened Now the customer posts a world wide warning about a a real bad problem that may be only 3 or 4 units have had.
Yes sir a real common problem here. I have sometimes had troubles booting this computer, maybe
MSDOS is hosed and I need Bill Gates to have a look himself The point here is to give some benefit of doubt to the company, as your message makes it appear every 2GXAT
has a loose screw.

If you intend to pay the bill, then it is certainly not illegal. However,
it is equally certainly in breach of your service contract, in case that
bothers you. And as Greg said, two simultaneous connections will probably
trigger anti-fraud software and you may end up with zero access and still
be required to pay the monthly charges. If you're sure you know what you're
doing, I say go for it :-)

3519. HELP,align army surplus handie set ?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-03 00:00:00 UTC
From: rpmackin@ashley.business.uwo.ca
Message-ID: <3o80q0$bh7@falcon.ccs.uwo.ca>
Source record: 218007

I bought a transmitter / receiver set at Dayton. It is a 6meter handie
transmitter and a receiving unit that clips on to the helmet.
The model numbers are:
Receiving set, radio, AN/PRR-9
Transmitting set, radio, AN/PRT-4, AN/PRT-4A

The reference manual refers to a technical manual for alighment procedures.
I wish to retune it to 52.525 and the local repeater freq 53.470 (52.470)
I also would like to bypass the PL squelch, if possible.
I know the rx unit is single channel, but the tx unit has two channel capacity
I have the user reference manual, but it refers you to another manual for the
technical details on alignment / servicing.
The number of the manual is:
TM 11-6625-937-12

any help would be very much appreciated...

From: "Peter P. Legorburu" <peter@phyvax.ir.miami.edu>
Message-ID: <3o85rp$blo@anshar.shadow.net>
Source record: 218010

At a recent billiards championship, a beautiful girl in a flowing dress hooked my IC-2SAT as she passed and it fell 4', breaking the rail on its BP-84 battery in the process. I've called ICOM, but they won't sell me a new enclosure for the battery as a replacement part (they want to sell me the whole pack). I just paid almost $70 for this battery, so I'd really like to fix it. If anyone has any idea where I might search for old worn-out batteries (I tried this year's local HamFest with no luck) that I can cannibalize, please drop me a line via e-mail. Also, is there a "marketplace" newsgroup on-line that caters to the ham crowd?

Thanks,
Peter

Message-ID: <1412965499-5176554@chemdept.chem.uoknor.edu>

Mike WA5CMI
your S-38 question is interesting. My National SW-54 has the same problem.
Please share the answer. Thanks Arni W5SRO

****

well, here is what I did. put the rcvr on the bench and probed the output
of the BFO. the tone was great. removed the probe, no tone. put the
probe back on, worked great!

soooo, I soldered an 8-inch wire to the BFO output and loosely coiled it
under the detector. Works great. I guess there just wasn't enough BFO
signal...hell, it may have always been that way. I did remove the wire
and tried to adjust the original "tickler," but never got it to do much.
I put the wire back on and it works great, just enough BFO signal to copy
even the strongest signals without loss of BFO stability.

maybe not the most scientific fix, but the receiver now works on CW.
incidentally, the BFO puts out a good looking signal.

Source record: 218012

Does anyone know how to modify a Icom IC-4A or IC-4AT, so that it will cover 430-440 Mhz. instead of 440-450? If this is not possible, does anyone have any used IC-4E's for sale? (I need two of them for an experiment).

If anyone is interrested I have a Midland Syntech VHF low band rig that currently covers 6 meters to trade for these.

You won't find MMIC's at $2 a shot for those power levels. The $2 a pop MMIC's are only good to about 50 mW, above that you can still buy MMIC's but they become progressively more expensive.

I'd like to get into ham radio. Like the title said, I'm just starting off, reading, listening and learning. My question is this. To start off I'd like to build a QRP transciever to begin with, ie, learn as I go along and listen until the ticket comes before I key up. Is this the way to go? What you you recommend? Is it prudent to go to RS for a hand held 2m and start that way?

Hi Erik, welcome to the hobby.

I started out on HF a few years ago and got into the 2 meter repeater scene a year and a half later. Looking back on it, I believe I could have done better the other way around. That is, there is a lot of help available right in your own city, but unless you already know the people, you'll be doing it all on your own.

That's okay, it really fosters a geat feeling of self reliance but simple mistakes can send one off into the wilderness for a long time. I was fortunate. I managed to somehow make uninformed 'right' decisions.

I'm a reluctant appliance operator so I can't tell you much about the kits. I would REALLY like to be able to find the time to assemble one. :-)

I'd think that without an elmer (mentor), a new ham could become quite frustrated if the rig didn't work right. Without some amount of experience it's difficult to determine whether the receiver is bad or the band conditions are responsible for poor reception. (one example, there are others)

Good luck on your quest.

You should probably buy the manual from Schaumburg. 1-800-422-4210.
It's going to cost around $20.

>I would like to use one mode (channel 8, I think) for monitoring and
>was wondering if anyone could provide me with the information to fire
>one of these up as a receiver?

Did you program the frequencies you need into the EEPROM? If not, you
could hire the work out to Motorola. I think that costs around $50.
Without the control head, you would have to hand-wire the frequency
select signals necessary to set Mode 8. You also would need to clip
onto the control head connector(s) to connect your speaker, and volume
and squelch pots. My advice would be just to buy a control head.

I think the T73VXJ is a Syntor X for High Band. I do have the manual
for this radio, so if you had any more specific questions, and don't
want to buy the manual from Motorola, I could help you out.

If you want to email me, use this address: zilmer@dt.wdc.com. The

All of these suggestions are good ones and I have a couple of additional
ones:

If you can visit any local clubs, visit them as soon as possible. Introduce
yourself around (some clubs are good at handling newcomers, some not so, but
most hams will be glad to meet you) and learn some of the names and calls.
Then when you hear them on, you won't be a "stranger" calling them,
you'll be a new friend. Lots of people find it easier to talk to people
they've already met, whether they're old-timers or newcomers.
Also, listen for a general net on at night... one that allows a
general comments and conversation period (ragchew) rather than a
seriously moderated traffic handling net (you can usually tell, just by
their casual method of operation). Most informal nets LOVE to have new
check-ins (at least around here they do), so you'll get to know some
more regulars on the repeaters.
Be aware, there are a few "bad apples" and "old grouches" on the ham
bands (and I have to be careful, I've been licensed almost 27 years
myself, but I was licensed at 13 so I'm still a youngster! :-),
but most people are friendly and helpful to newcomers. If you encounter
a "bad apple", sign off with them quickly and try again later.

73 and good luck,

3532. Icom 2700H

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-03 00:00:00 UTC
From: bsager@infi.NET
Message-ID: <199505031833.OAA14870@larry.infi.net>
Source record: 218020

A friend and I purchased two Icom 2700H's from AES last October and so far have not been happy with them at all. We are both MARS members and so we opened up the range of the receiver/transmitter with the factory provided mods. His has been back to the factory repair site 4 times for the same problems which are very bad intermod and cold soldier joints. Mine has been back twice. We installed the tone board to try and help with the intermod problem and that did help somewhat but actually it just masks the problem. We both live in the Washington, DC area which seems to be a giant intermod producing valley and expected some intermod problems but for the price we paid for the radio, we falsely "assumed" that Icom would have their top of the line dual bander better tested against intermod and cold soldier joints. The radio gets very "warm" even when you are doing nothing but listening. Icom suggested programming the radio to have the "fan on" at all times to keep the radio cooler since that is why they think the radio is continually having so many "cold" soldier joints.. The control head "controls" (primarily the volume & squelch) become inoperative from cold soldier joints. Mine now has the UHF side volume control intermittent while his is the vhf side inoperative this time. Icom says they are working on the intermod problem and think they have the cold soldier joint problem under control. But according to our radios that they don't have it under control. The radio's control head "controls" will normally operate for about a month once it comes back from the repair center before they act up again and the fix is always cold soldier joints! Both radios are installed in vehicles.

We are wondering if we were just unlucky and got 2 of the first radios produced before all the "bugs" were worked out or if this is a wider spread problem?? Has anyone else had the problems??? Thanks.
(BTW, the radio is great when it WORKS).

3537. HTX-212 Power plug

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-03 00:00:00 UTC
From: bennett@cis.ufl.edu
Message-ID: <3o8oes$4vj@sand.cis.ufl.edu>
Source record: 218025

Hope someone out there can help with this. I recently purchased an HTX-212 mobile 2 meter rig from Radio Shack. It comes with one power cord. Well enough, one is enough for installing it in a vehicle. Unfortunately I also want to be able to use it both as an ac base unit and a battery powered base unit. So, I do the logical thing and contact Radio Shack. The local store was unable to help me, the connector on the powercord appears to be a non-stock item and, from the store's comments, the parts department could not help them. I have tried other sources, including large electronics parts vendors and several automotive parts dealers. I could kludge something together but, if I can find the proper parts, I would really rather not. Any advice or information on either the cable or the plug used would be welcome.

From: Jeff Krul <JKrul@equist.com>
Message-ID: <3o8nlg$ode@noc.tor.hookup.net>
Source record: 218026

I am planning to put up a brand new NON-free-standing tower. It will be comprised of 3 10-ft sections, and then the mast on top of that. The base will be poured concrete. The first 10 feet will be attached to the house. The SECOND 10 feet will be attached to the house. The THIRD 10 feet will NOT BE ATTACHED to the house.

My question is : "How stable will the last 10 feet of the tower be, if the only thing holding it in place is the three posts of the section below it? I am planning to climb the tower to make changes, etc.."

I would appreciate any information you can provide.

Thanks in advance,
Jeff.

Most cellular service providers will let you assign two cell phones to the same telephone number. You must only have one phone turned on at a time...otherwise you might confuse either the cellular network or the cell phone. Give them a call.

This will work just fine... I have a similar setup in my airplane.

Be SURE you have an A&P signoff for the installation, just to keep
the FAA happy.

Hi Mike,
You missed the all important 1 db compression point.
You can usually get LESS than 200 milli-watts out of these devices!
They are for LOW power applications.

Now... 3 is 2 and 10 is 10...
db that is Every 10 db is 10 time or time less power.
Ever 3 db is twice or 1/2 the power.
?ever?
So 20 db is 100 time and the other 5 is almost times 4.
So 25 db is less than 400 times the power.

Simple no?

There are Hybrids that will amplify your signal to higher powers!

Tom

3543. Re: Icom 2700H

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-03 00:00:00 UTC
From: kjsmith@violin.aix.calpoly.edu
Message-ID: <3o8n1m$2hup@violin.aix.calpoly.edu>
Source record: 218031

Interesting... I, too, recently bought an IC-2700H, with my reasons for purchase as follows: small face plate that's remotable, microphone comes off the radio, NOT the faceplate, and then the general features, controls, etc.

I was extremely happy with the radio out of the box. It's very easy to use, provides sophisticated features, etc. I did drive to San Jose area and noticed very little (if any?) intermod, whereas my scanner was getting hammered (it is a cheap scanner, though).

But the cold solder joint crept in with me as well. If I get in the car early in the morning or late at night where the temp is below 60F, one of the buttons (left VFO knob, knob works, but pressing to change bands didn't) failed. WHen the radio gets hot (15mins to an hour, depending on ambient temp and display backlight level), the thing works fine.

I finally gave up (I tried to look at the service manual and find possible problem points, but the SMT is too much for my eyes and equipment to handle) and shipped it back to Icom. Hopefully this will take care of the problem. Fixing intermittant heat-sensitive problems is a real bear, so hopefully they'll have better luck than I.

BTW: A friend who bought a IC-2700H doesn't appear to be having thermal problems, but after doing the install in his vehicle the thing is blowing 20 amp fuses...

Has Icom's quality control gone to hell?

Chris Smart (chris.smart@canrem.com) wrote:
: Hi! I love my Kenwood 251-A, except for the fact that local pagers in my
: area wipe out some frequencies, and make some fairly local repeaters
: unusable. Can I get some sort of filter to get rid of some of this
: intermod? I don't need to get rid of it all, just cut it down
: significantly to let the repeaters through on a couple frequencies.

I built a helical resonator from the ARRL handbook which is perfect
for this kind of application. It ended up about 6MHz wide with a power
limit of about 10 watts. Originally I built it for T-Hunting but ended
up using it on my TH-78A before I sold the radio. If you built one, you
will need to use high Q piston trimmers with a maximum capacitance of
10pF (4pf would be better).

I've been running a 2700H for almost a year now with no "cold solder joint" problems at all. My radio goes from the house to the vehicle regularly, from ambient temperatures of -30 degrees to +30 degrees (C). I have noticed that the radio runs warm (not hot) even when on receive only, but the overall temperature of the rig chassis doesn't seem to change when transmitting for long periods (I have my fan set in the "auto" position).

I agree that the front end is poor and that pagers come through loud and clear, but it's been my experience that this is typical for most new rigs. I've run mine with band-pass filters installed when necessary. Other than that, my biggest complaint is that there seems to be no way to put the rig into X-band repeat mode from the front panel (or mic). I can do it through remote control, but there's been several times that it would have been handy to do it from the face (or mic) of the rig.

73 & good luck!

I have two different types; the AEA Hot Rod and the ANLI 800 dual band. I
have found that the AEA Hot Rods (both the 2M and 440 version) slightly
outperform the ANLI dual band but if you want t dual bander, go with the
ANLI. Beware that the price is about $35 to $40 and the optional rubber
duck that comes with it sucks.

Gerald,

I've only heard great things about this little radio - and
being an owner of one I endorse MOST of the praise. I do
have a few complaints though:

-low speaker volume - you'll have to get a good speaker/mic if you
want to hear it in the car, on your bike, etc.

-no power line-in. Yaesu gets you for another $50 or so if
you want to plug your radio into AC and $60 if you want to
run DC in your car.

-complete memory loss - if you run it a bit longer on the last
bit of charge - the battery low idiot light gives you about 5
minutes - all the memories are wiped out and settings are restored
to the defaults.

-useless digital squelch. I receive all kinds of noise that I
can't squelch out but I can on my Icom. This is especially annoying
if you're scanning.

-SLOW scan speeds. About 1/10th the speed of my icom HT.

-buttons wear off - 3 months of moderate use and I can't
read any of the important buttons brcause the printing comes off.

-weird code squelch operation - does not conform to the way
Kenwood and Icom handle code squelch

Good things - it's small, the lit keypad is awesome, receiver
works really well even with the rubber duck, and with all
the power saver features it'll run a long time even with
the little battery.

My two cents worth, Keith Kraiser KE6OTG

3555. How to Reset Azden PCS-3000?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-03 00:00:00 UTC
From: veith@cherokee.nsuok.edu
Message-ID: <D80FtJ.200@cherokee.nsuok.edu>
Source record: 218043

I have an Azden PCS-3000 bought third hand that has served me
well for several years. Today, though, it crapped out. The
display shows only 5.0:00. The colon is under the "ul" mark
on the panel. I have never seen it before. It is locked up
and will not transmit.

I'm assuming it needs a microprocessor reset. On the case it
refers me to page 12 of the user manual. I do not have the
user manual. I've tried various common keystroke combinations
while turning the reciever on and off to no avail. Since this
is an older unit I suspect I need to poke a miniswitch somewhere?

Am I on the right track with this? Can someone help, please?

Thanks,
Charles

>out-of-band receive tuning range than indicated in their recent ads. Does
>anyone have the full facts?
>
>Tnx es 73,
>
>Danny Goodman AE9F/6
>Author, "Living at Light Speed"

My 508 indicates that it will tune from:
Band 1: 100MHz - 200MHz
Band 2: 300MHz - 400MHz
Band 3: 400MHz - 520MHz
Band 4: 700MHz - 1000MHz

The VXO will not lock in all places, I haven't spent the time to find out
where it falls off. The entertainment band is locked out, although, the
mod I hear is just a keyboard entry. I don't know the mods at this time,
but I am sure that someone will post them real soon...

Plain old terminal programs work quite well on Macintoshs for packet.
You might start with ZTerm as the shareware fee is reasonable and its an
excellent choice for dial up telephone use. Then again, maybe you allready
have something for dial up, that you are familiar with, so why change?

Its been a while since I checked ftp.ucsd.edu:/pub/hamradio/tcpip/mac,

```

From: werner@acsu.buffalo.edu
Message-ID: <3o6q2g$7vg@azure.acsu.buffalo.edu>
Source record: 218095

Hi,

I'd like to get into ham radio. Like the title said, I'm just starting off, reading, listening and learning. My question is this. To start off I'd like to build a QRP transciever to begin with, ie, learn as I go along and listen until the ticket comes before I key up. Is this the way to go? What you you recommend? Is it prudent to go to RS for a hand held 2m and start that way? Also, what kits to you recommend. I've gotten catalogues from TenTec and Oak Hills. The one from O.H. shows a dual 40,80m cw kit. Are there ones I can build out there that are not exclusively CW?

Any suggestions on how to get started are appreciated. Thanks.

Erik Werner

TUCKER makes a intermod filter for under $100 - 800-559-7388. Also
another company that sounds like Edico, or something makes one. I use
Tucker's and it works well.

I have for sale a TH6DXX tri-band beam (10-15-20) for which I'm asking $325 and 5 sections and a top section of Rohn 25G. The top section has a plate for a thrust bearing. I also have the guy wires (three sets), turnbuckles, and various mounting hardware for the guys. I am asking $225 for the tower and accessories. If you are interested please email or call me at 214-233-2386. I am located in Dallas, TX, and it is not practical to ship these items. I also have a CDE CD-44 rotator without the control box for which I'm asking $35 plus shipping. Thank you much for reading this...Fred W5HTR

The narrower and more restrictive the group topic is, the less support
it will have. QRP is well understood and has lots of interest. Heck,
even I'm interested in QRP, and I have 75 acres in the country. Let's
keep the name short, sweet and well understood.

> 73's Ralph

Forward (and backward) slashes are "forbidden" characters in newsgroup names. The reason is that all news server software sooner or later has to access files and directories, and since the usual convention is to map the dot-delimited components of a newsgroup name into subdirectory names, the slashes could possibly be misinterpreted by the operating system as directory-name separators.

> the _internal_ speaker. :-(

I assume you are trying to listen to the sub-band receiver while =
transmitting.
If so, enable the duplex function, press FM then 9 (DUP flashes in the =
display).
There is also a MUTE function (FM-8) that will mute the subband if the =
main
band receiver becomes active.

> PS: Did anyone modify a US version of the FT-51R for european purposes
> (i.e. enable the 1750Hz burst tone)? If so, please drop me an EMail.

While modifying mine to allow expanded transmit (I need to transmit down
to 420 for my ATV work), I accidentally shorted pad 6 which enabled the =
1750
tone burst. There is 2 columns of configuration pads, 4 on the left and 3 =
on the
right. The middle one is pad 6, I believe.

Source record: 217956

I should elaborate on a few of my comments - I was
a bit tired last night.

For the DTMF code squelch - both radios involved have to
be using the same 3-digit code. The feature works fine if
thst's the way you want to operate. Icom and Kenwood (and
probably others, but I'm not sure) use individual codes for
both your base station code and who you want to call.

e.g. I could be 333 and you are 444. I can talk to you
using my code squlch memory 444. Or to someone else who is
555, etc. For the Yaesu, We both have to be set on 333 or
else we can't talk. That's fine as long as one person always
has his radio set to a certain code and I just dial it in
to talk, but it gets to be a pain to always reprogram the
memories.

Concerning the squelch. It's not a problem at all in the HAM
bands. I should have qualified that. The squelch is calibrated
for them pretty well. It's only a problem when you're scanning
out of band. I'm also in a pretty built up area so there's a
lot of noise.

Good luck, do you think I should post this reply? Keith Kraiser

It is old and has been replaced by the FT-23, which was replaced by
the FT-411, which all have the following problems.

It is insensitive above 152 Mhz (you only care if monitoring police,
public service or outside the ham bands).

The battery pack is too small. To have your radio work "all day", you
need to carry a spare battery pack.

The receiver has poor selectivity, it does not reject adjacent
channels and is very susceptible to intermod interference.

For $75, you might be interested in owning one. For more than that, no.

3577. Adding gain to the Mirage C3012 220 amplifier?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-04 00:00:00 UTC
From: little@iamu.chi.dec.com
Message-ID: <3oauqj$6jj@jac.zko.dec.com>
Source record: 217958

I have a Mirage C3012 220 amplifier. From looking inside of it, it appears that there is a gain section that has been left out. I'm assuming that they probably use the same design and board for their various 220 amps, and depending upon the input power and desired gain, they add or remove gain sections. Can anyone confirm this? If it is the case, any ideas of what's involved in adding the additional gain section such that I could drive the amp with considerably less power? Ideally I'd like to try and mate this thing with a 220 transverter that I'm building that only yields about 50 mW. Any and all suggestions greatly appreciated.

From: allenw@teleport.com
Message-ID: <3ob377$q6b@kelly.teleport.com>
Source record: 217960

I tried to mail this out, but the mailer got a unknown user error...so
here goes through the newsgroup...
--

I have this same mic and HAD the SAME problem... I sounded like I was
talking through a tin can! What I did was the following...

Un screw all the screws on the back EXCEPT the screw in the
middle of the belt clip! That will remove the blet clip and be VERY hard
to put back because of the spring load.

Carefully remove the back and front panels so that they can lay
side by side.

locate the mic, it is near the speaker, a little to the right as
you're inside (if I remember right), although not hard to find. pull the
mic out of its holder (if it already hasn't fallen out on its own.) and
blow the mic holder (ie clean the dust and other crap out of the unit.

Then make sure the mic is clean too.

Now put the mic back... make sure you put it in SECURELY (I think
Yaesu, when putting these guys together didn't put the mic in all the way
snugly, so the mic compartment get crap inside and dangles inside.) If
you put the mic back firmly and it doesn't rattle around, you SHOULD be
okay, you may want to look into whether the mic is bad after that.

Note: I think there is a hole to the SIDE of the mic holding
compartment that allows your voice to the mic. In other words, I don't
think that drilling is neccessary. But could be looked into, although
there is more possibilities of getting the mic damaged or garbage inside.

Put the front and back together again making sure that the wires
aren't in the way.

Rescrew the unit together...

This SHOULD fix the problem, if not call Yaesu and ask them for help.

: /Anders - SM5BVS

Yes, this is a good modification. I hadn't read yet about it when I
compared the audio from the 530 itself and then from the speaker mike by
recording my transmissions into another receiver. Thespeaker mike produced
a rather muffled sound compared to the mike in the HT itself (which DOES
have a case opening in front of it).

Solution: Open the mike case and separate the front portion. See where the
microphone element is located and just in front drill a SMALL hole
in the front case of the spkr mike. The hole I drilled was small enough
to fit right in one of the grooves on the front. It cannot even be noticed
unless you look very hard. The audio is reported to be much clearer now,
with improved high frequencies.

YAESU FT-51R

Expanded Transmit 140-174 MHz, 420-470 MHz

MARS & CAP MODIFICATION

This information is authorized for distribution only to individuals who are members of the U.S. Military Affiliate Radio System, Civil Air Patrol, or other government agency services specifically permitted by the FCC to use non-Type-Accepted equipment such as that utilized in the Amateur Radio Service. Release of this information to individuals not bearing a license in the MARS, CAP, or other such government service is not authorized by Yaesu U.S.A.

* Remove Antenna and Battery

* Remove (6) black screws in rear plastic cover plate (where the battery would normally fit)

* Remove the (1) small black screw in the battery slide switch (see figure 1 below for screw locations)

* Loosen (but don't remove) the (4) black screws on the upper back of rear case and slightly separate the rear radio case.

* Remove the "L" type plastic cover

CAUTION: Watch out for the delicate ribbon cable

* Locate and unsolder jumper pad #6 (see Figure 2 below for jumper locations) (Pads 1,7 should now be jumpered) (Stock, Pads 1,6,7 only)

* Reinstall the "L" type plastic cover

* Tighten the (4) case screws on rear case

* Re-install the (6) black screws in rear plastic cover plate.

* Re-install the (1) small black screw with the battery slide switch

* Now attach the antenna and battery

* Turn off Radio... Press and hold both UP & Down Arrows Keys (right side) while turning on the Radio

* Modification now complete!

(Figure 1 not rendered; my ASCII art skills aren't that good)

Figure 2: Jumper locations. For European tone burst, add solder to jumper 4.

Jeff -

I have almost the identical setup. A 50' Rohn 25 tower set into a cement pad roughly 2.5'x 3.0' x 5.5' deep, house-bracketed at 25' with the top 25' (plus 10' mast) essentially free-standing.

Given that your tower is well-constructed and in good shape, you shouldn't have a problem. We had two fairly beefy folks (220 & 210 lbs.) go up it to install the Swan tri-bander, one at the top & one at the 30 foot level. The tower felt very stable & secure, even with 10-15 mph wind.

The essential elements are a big enough & deep enough base to resist the tower's overturning moment, and a <very> securely anchored house bracket. Most trianglular steel or alloy towers have very high resistance both to down force and rotational torque, so a 200 lb person doing something silly, like hanging by one hand and one foot represents approximately 2000 foot-pounds at the end of the ten-foot lever, well under the Rohn ratings of 10,000 to 12,000 foot-pounds for the model 25, for example.

Anders... If your mic was one of the earlier ones made by Yaesu there is no hole for the mic itself inside the display mic case. I purchased my mic just after they were introduced, and there was no hole. I too had complaints about the quality of my transmitted audio and I called Yaesu. Yaesu said that this was not a design flaw, but I noticed shortly after that every mic shipped new from Yaesu had a hole where the actual mic was.

I don't think that the person who suggested drilling a hole was joking. That is what I did, and was quite pleased with the result. If I were you, I would drill the hole. Use a SMALL bit (I do not remember the size that I used)... I would also recommend drilling the hole with the bit buy hand. Also, If you are careful with the placement of where you drill, the hole on the outer side will open up in the recessed area of the mic and will look much nicer. You will not be able to see the hole unless you look REAL closely. This will improve your audio 1000%....

Thanx.

3602. Re: S-38 BFO

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-04 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <f57_9505041730@mba.mba.org>
Source record: 217983

Visor@globalcom.net brings up the point that he remembers that the S38 did not have a BFO, but provided a beat by putting the IF into oscillation.

I think he's right. I recall seeing things about this; I seem to recall seeing at least one article on upgrading the S38, and it included adding a separate BFO.

But if I am remembering this right, then I also remember that the S38A did add a separate BFO, for what it's worth.

This technique of using the IF amp for the BFO was used in other receivers at the low end of the price range, too. The idea is like a Q-Mulitplier or regenerative receiver. If you add a little bit of feedback around the IF amp, it improves selectivity, though not the skirts. I seem to recall that one cheap receiver had a feedback control to take advantage of this. If you add enough feedback, the thing oscillates and you have a beat oscillator. But then you lose the selectivity that came from the not-quite-oscillating feedback..

And yes, if the IF is not aligned properly or is low in gain, it could affect whether or not the "BFO" is working or working properly.

The talk of the weak BFO in the Hallicrafters S38 reminds me of my first receiver, also a Hallicrafters. It was the S-120A, and was transistorized. There were all these signals on the hambands that I couldn't tune in. It didn't take long to grasp that they were SSB signals, and turning on the BFO was supposed to take care of it. It didn't. The BFO allowed for CW reception okay, but turning it on did little for SSB. It sounded like things were distorting, which I'd come to expect, since the whole receiver was terribly proned to overloading from the local broadcast station. Eventually, I picke dup on the idea of an attenuator at the front end, and put a pot I had on hand between the antenna and the receiver. Suddenly, I could tune in some SSB signals. Of course, only the strongest could be heard by the time the signals were attenuated enough to work.

The problem was of course that the BFO was way too weak. Attenuating the signals made theBFO muich stronger than the incoming signal, and so there was enough carrier to reinsert.

I never had a schematic for that receiver, but thinking about the S38 now, I wonder if the S-120A also put the IF into oscillation. It was a crummy enough receiver (though it cost me enough at age 11) that I wouldn't put it past Hallifcrafters.

: I started out on HF a few years ago and got into the 2 meter repeater
: scene a year and a half later. Looking back on it, I believe I could
: have done better the other way around. That is, there is a lot of help
: available right in your own city, but unless you already know the people,
: you'll be doing it all on your own.

It shouldn't be too hard to find a local radio club, unless in the
boondocks. Such info. should be available at a local Radio Shack or
electronics supply store. Unfortunately, having a local store that sells ham
gear is becoming quite rare; obviously, this would be the best choice for
info.

: I'm a reluctant appliance operator so I can't tell you much about the kits.
: I would REALLY like to be able to find the time to assemble one. :-)

Yeah, I really miss the Heathkits. They were a lot of fun to assemble.
Naturally, they were also easy to troubleshoot and repair. The complexity
of radio gear today really makes me wonder if the average ham, even with a
background in electronics, could feasibly repair the rig. The only folks I
know who can do that now, either are radio techs with test equipment at
work, or old-timers who have built test equipment.

Actually, I heard the term "appliance operator" back in 1968, when I bought
my Drake R-4/T-4X twins. Even at that, servicing instructions were
included: schematic diagram, and complete alignment instructions.

: I'd think that without an elmer (mentor), a new ham could become quite
: frustrated if the rig didn't work right. Without some amount of experience
: it's difficult to determine whether the receiver is bad or the band
: conditions are responsible for poor reception. (one example, there are others)

It's best to get mentoring from an experienced ham, or "Elmer." Mine was
great; at the age of 16, I doubt that I would have followed through, even to
the point of a Novice ticket. He gave me the test, helped me to set up my
station, made the first contact with me, then left me to learn on the air,
all along offering constructive advice. Unfortunately, since his license
was not renewed a couple of years ago, I assume that he is a silent key.

Why not call Motorola, (800) 422-4210 and buy one? The Maxar-80
manual I bought was $25 or so, and sure beat a cheesy copy.

>Thanks for your help. I'm gonna try to convert these radios to 9600 bps

I had the same problem. Both my 22 and 79 went dead but the 79 kept
the memories. Luckily I had another 22 for my son and we cloned his
info to mine. Kenwood has the info to clone, etc. In the absence of a
second 22 I can only recommend having a battery in the car, home, etc.

73's,

Dave, AB7FV

You missed the Kenwood TH 22. In the standard configuration it's 3
watts out and 5 with the 12 V battery. But it's small and very pocketable
with the standard battery.

Good Luck,

Peter,

I broke the rail off of my BP-84 and I put it back on with Crazy Glue.
I figured I didn't have anything to lose ... and it worked.

The pack was an off brand (not an Icom) and it was wearing to the point
that somtimes my W2A would turn on and off. I must have glued the rail
on a bit wrong, but that mistake took up the slack and the battery now
fits perfectly.

Hope this helps,

Contact Cleaner is getting harder and harder to find.
The places that still cary the good stuff have taken the price past the ceiling.
But for what it's worth, we now only use Dem-Kote Contact Cleaner,
It is available from Grainger for a very reasonable priece, the catalog number is 4X598B.

It does not leave a sticky residue like about 90% of the contact cleaners on the market today....

I'm interested in hearing about dual band mobiles, as I've finally convinced my wife to get her license, and we'll need to get two new rigs (she probably will do more talking with me than ragchewing, so we'll want encoding/decoding).

I recently looked at offerings by Icom, Kenwood, Yaesu and Alinco, but would like to hear from people who are actually using them. I've also heard that Alinco's coming out with a new one within the month that'll have a band usage graph which sounds interesting...

Please tell me why you bought yours, what you like and dislike about it, and what you'd get if you had to do it again now.

Thanks in advance. If asked, I'll summarize.

Email please!

I have a Mirage D1010N 100 watt UHF SSB/FM amplifier for sale. It will do a solid 100 watts out with 10 watts in on 430-450mhz. It will operate with less than a watt input, so one could use it with an HT. I have had new RF transistors installed and it works fine. Cosmetically, it is in good shape, no major dings or scratches. I'm asking $280.00 or best offer. Contact me via e-mail at the address liste in my sig.
Thanks,
Scott

Have you see like a BNC Y-connector that allows two single-band antennas to be connected to a single HT? I think that maybe give me the best of both worlds unless there are electronic conflicts between having two different antennas connected to the same HT. BTW, I own an ICOM IC-Z1A.

I don't have the answer to your question, however I would like to make this comment.

The comet miricale baby is the only antenna i use on my ft-530. The gain is almost none, if any. Howver, the small size is its biggest asset.

If you are working on the fringe area of a repeater, or simplex at some distance, the gain may not be enough. The stock antenna would work those fringe areas much better I suspect...

Message-ID: <1995May5.163202.10496@galileo.cc.rochester.edu>
Source record: 217915

I was looking into the JRC 245 and the Icom 736 before, but I have now broadened my search to include the Kenwood TS-850/SAT. I know the 850 doesn't have 6m, but it is a little cheaper and it looks like it has some good features. My antenna would be an AEA Isoloop which is only good for 30m to 10m. Of the three radios, which of them would have the best RX? Feature wise, which one would be a good choice? I plan on keeping the radio for several years. I know the 850 is an older model, is there a new version coming out soon?

Thanks.

Source record: 217918

Please e-mail me with your thoughts:

The backlit display lights but there is no display.
Lithium battery is OK.
In testing the voltage on IC6 of the control unit it had only 2.3 volts output. When tested out of curcuit it had 8.2v out with 13.6v in, so it appears to be working. IC6 gets hot when in service.
It seems something, possibly shorted, is drawing down the 8v line.

Any suggestions on common causes or where to look next?

Thanks for reading,

>would have been handy to do it from the face (or mic) of the rig.

Ray,
You can put the radio in Xband repeat from the front panel. The procedure
is as follows:

1) Set the desired frequencies for both sides
2) Press and hold both MAIN VFO Knobs and the SET button (until you get the beep)
3) This will place the radio in X band repeat
4) To exit this mode press and hold the SET button

I recently bought the 2700H also. All in all I like the radio a real lot.
The intermod is a problem however in my opinion its typical for a dualband
radio. I think it really depends on your antenna and location. If you're
in a high intermod area - well get used to it.

My biggest problem with the radio is the mechanical design of the front
panel. I think ICOM cut one too many corners to come up with a quick and
cheap mechanical design. If they paid more attention to the front panel
design I think the radio would have been a real winner. A quick release
mount would have been nice. Also, you mount the front panel to the
remote bracket using velco. It works ok but the velcro covers the slots
that allow you to remount the front panel to the main unit. The remote
cables are so small that it's somewhat difficult and tricky connecting
them up.

Don't get me wrong, I like the radio a real lot and would buy another one
but it bummed me out that such an expensive radio had a cheap mechanical
design as far as the detachable front panel was concerned.

As far as the radio running hot, mine definitely runs warm just like my
IC229H. Let's face it, the radio draws up to 12 amps while transmitting
and outputting 50 watts. Where else is the remaining 90 watts going?
It's dissipated and the radio gets warm. That's normal especially for
such a small box. I have heard of some 2700H's putting out up to
70 watts on 2 meters! Not sure if that's healthy or not, but if you radio
is burning up maybe you should check the output power and measure how much

current the radio is drawing. I use my fan in the automatic mode and have had no problems.

The radio is full of all bell's and whistle's. I compared it to the Alico and Kenwood and liked the ICOM. I heard the IC2340 and 2350 are nice radios too.

Did you guys get the IR microphone. I thought it was just a gimmick, but the thing really works. I use the IR mike all the time and have had great luck with it.

Well, good luck with your radios. I hope all the bugs and problems are worked out. In the past I've had great luck with ICOM's technical support. It you feel that you bought a real lemon, I would contact ICOM and ask them for a new radio. These things are cheap and if you pay over $750 for a radio it better be dependable.

ANLI AL800 antenna. Has 2mm/440 cap and comes with both an expanding antenna
and a rubber duck which mount to the common base. I haven't found one as good
yet, I even bought one for my scanner.

>connected to the same HT. BTW, I own an ICOM IC-Z1A.

>Shade

The weak link on almost all hand helds is the bnc connector. Putting two
antennas, especially expandable ones, will almost certainly leave you
with a broken bnc. You would need a switch box to isolate the antenna
you aren't going to use so might as well get a mobil and carry a large
battery in a back pack...

The ANLI will give you what you need, and sides, all rubberducky antennas suck.
They are not meant for anything besides close work.

3641. Alinco's New HF Rig; Anyone Seen it?

I just saw an ad for a very small Alinco HF rig that covers
everything from 160 m through 6 m at 100 W output. It comes with all
filters installed. Aside from historically poor operating manuals, Alinco
seems to make nice gear. Has anyone seen one of them? Any idea what they
cost?

3642. AN/GRC-109 Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-05 00:00:00 UTC
From: scoggin@deimos.delmarva.com
Message-ID: <3oe4qj$66u@blackhole.delmarva.com>
Source record: 217925

I am in the market for an HF transceiver, primarily to receive W1AW code practice (working toward an Advanced) at the moment. I have a desire for something reasonably rugged, for use in my volunteer work with the Delaware Emergency Management Agency. I saw the AN/GRC-109A transceiver in the Fair Radio Sales catalog this week and was intrigued. According to the latest Army Field Manual that I have, the 109A is still in current use with the Signal Corps.

Anyone have any experience with this equipment? Advice, warnings? Is it easy to repair?

Thanks.

Thank you for taking the time to read this message.

I have a Kenwood TH-78A available for sale. It comes with the standard 700ma battery, an 1100ma long life battery, a 1200ma long life battery, an alkaline battery holder, a speaker mic, the vox headset, the rapid charger for the batteries, and the unit has the following mods: expanded transmit and receive, 800 mhz (yes, including cellular) and has 250 memory channels.

The rig is in good condition. The whole package is available for $600.00. If you're interested, send me an email at elmer@pennet.net or call 717 323 4365 (provided I'm not connected.)

Thanks and 73's.

I did. Indeed the little coax connector is made by Philmore.
Unfortunately I lost the package/part #. Those connectors are sold by most
(decent size) electronics stores. Even here in Fresno, CA I know of
at least one that carries it. I don't think they mailorder. Bring
your radio when shopping.

Sometimes it takes a few months for Radio Shack's National Parts division to get in spare/repair parts for new items. RS often works on getting the product out first, and the parts second. Generally though, the parts are available within a few months of the product introduction.

You should be able to get the public "800" number to National Parts from your local Shack. Keep checking with them from time to time, and eventually they'll have it. I'd expect it to cost you roughly 5 bucks.

My friend N2VYC asked me to post the following for him.

MOTOROLA HT-600 6-Chanel VHF with the following:
. 1-Eight hour charger
. 1-One hour charger
. 3-Motorola batteries
. Speaker Mike
. Hard leather Swivel Case
. Leather strap
. BNC Adaptor
The radio is in mint condition and is selling for $375.00.

ICOM 1CW2A Dual Band with the following:
. Wall Charger
. Rapid Charger
. Soft Case
. 2-Batteries
. Speaker Mike
. Filtered Car Cord
. AD-20 Adaptor
. 7 Amp power supply
The radio is in mint condition and is selling for $450.00

N2VYC will ship you pay COD. If interested E-Mail me and I will give you
his phone number.

Thanks

Please stop suggesting rec.radio.amateur.qrp - there's already a very
fine qrp email list with a high S/N ratio. Last count there were
400 subscribers. Now that doesn't sound like enough to warrant
a newsgroup, does it? In the past 3 years every time a suggestion
was made to shift from an email list to a newsgroup the suggestion
was always vehemently voted down.

If the low-profilers want a group, then why not start an email list?
Such lists are very very successful, for they target a select-interest
group and as a result the noise level is quite low (no flame wars).

With well over 7000 newsgroups some sites may have reached the saturation
point and choose not to subscribe to the new rec.radio.amateur.low-profile.

73 from Hawaii,
Jeff NH6IL

Nick:

You are going to need the manual if you can't even figure this one out...it's very intuitive.
Simply push the "VFO" button to go to that mode and punch in the frequency you want.

Maybe you can get a manual through Yaesu. Congratulations on the FT-11R..it's a great little rig.

Source record: 217855

I've had my 530 for about 6 months now and like it very much. Very few complaints. It is a nice size although larger than the 51r. It is more susceptible to intermod than some merely because it has such a wide-band receive (110-174 mHz). It has AM receive if you're into that. And the keypad and display are lit, which is VERY nice at night time. The Rx battery saver works marvelously, the Tx power saver not so hot unless you're simplex. 2 volumes is very convenient. Don't use the paging features. Like the power plug on the TOP of the radio much much more than on the side or on the battery pack. You can plug in the mic, antenna, and power, then slip the radio down between the seat, etc. No wires out the bottom or sides. Sometimes the 2m side interferes with the 440 side due to internal harmonics, but Yaesu had a free modification (under warranty) that will reduce this. Personally, I use the clock and auto-on and auto-off functions and think they're great...

Sorry for the jumbled thoughts. I was just jotting down off the top of my head. Let me know if I can help you out any more...

Source record: 217856

The audio on my display mic was what I would qualify as horrible. I sent the mic back to Yaesu, and they added the little hole on the front as has been suggested. That helped, but it STILL is noticably more muffled than using the mic on the radio. Maybe I should take it apart myself and drill a little bigger hole???

Anybody out there have their display mic such that it sounds every bit as good as the radio mic? Not muffled AT ALL? I'd be encouraged to know that it is at least possible...

Would someone please explain to me why you need a synthesized repeater???

I don't get it. What are you going to do? Change frequencies every
other week? Seems to me it would be simpler and cheaper to generate a
cleaner signal with good old fashioned crystals. Am I missing something?

I don't have the answer to your question, however I would like to make this comment.

The comet miricale baby is the only antenna i use on my ft-530. The gain is almost none, if any. Howver, the small size is its biggest asset.

If you are working on the fringe area of a repeater, or simplex at some distance, the gain may not be enough. The stock antenna would work those fringe areas much better I suspect...

73's....andthanks for listening....

rbw
wallace@leland.stanford.edu

I second this response! The antenna works almost as well as the original rdck on 440 but loses it on 2mtrs like you would expect. But ultimately handy for close distance work. Super on a small ht like the Ft51r.

I suspose your are refering to the version that covers 400 - 430 MHz. Well canada has a land mobile band in the 420 to 430 MHz range. Some public safety is from 400 to 430 Mhz above
Line A. A radio that is synthized may cover many frequencies.

3666. IC-T41A Squelch Tail

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-06 00:00:00 UTC

Message-ID: <hideg.1-0605950001180001@hideg.cc.nd.edu>
Source record: 217861

I have noticed that the "squelch tail" (length of time between termination of an input signal and the actual close of the squelch gate) on my IC-T41A is longer than on other rigs I have. Is there any internal adjustment of this duration?

Thanks.

> coming out soon?

I don't know about the other two, but the TS-850 has a great receiver.
Test results from the QST review of a few years ago still place it as
one of the best receivers around. And the flexible filtering and
"slope tuning" features make it quite good at fighting interference.

There are flaws in the 850, but the receiver isn't one of them.

I've had mine for about a year now and I'm still very happy with it.
I've also operated quite a bit with an FT-990 during the same time
period and I much prefer the TS-850.

3668. 250,000 new electron tubes to the highest bidder

From: ncarrigan@aol.com
Message-ID: <3oeus5$9q2@newsbf02.news.aol.com>
Source record: 217864

I need to know how to (after turning the radio on) tune the radio outside of the ham bands. I'm looking at a used one, without a manual. When I turn the radio on, it defaults to the memories. I was able to hold MR and press the up or down arrow key to scan a little, but the radio wouldn't scan passed 144 or 148.. Is there some way to jump to the mhz digit?

Nick

How about rec.radio.amateur.covert? :-)

The point of the low-profile argument is that you don't want everyone knowing that you're an Amateur (whether it's because you're contravening apartment regulations, or to avoid drawing the attention of burglars etc.) Mind you, the "covert" also suggests clandestine third-world stations...

Ya, its gonna be used with the new auto-tune duplexer. No more need for
coordination. Just program your repeater to an unused pair. Its the best
thing to come out since musical tones on the ft-530.

I have for sale 1 Motorola MX 330. It is in pretty good condition and does work. This is a commercial hand held often used by police departments (at least in the past). It has two frequencies around 480 Mhz. Comes with batter, and rubber duck. Nothing else. I paid $75, but I'll let it go for less. Send E-mail inquiries directly to screa@aol.com. Thanks.

3690. Icom 2340H??!

Hello, thanks for reading:
I recently obtained an Icom IC-2340H 2-m/440 mobile radio. I am somewhat satisfied with it, BUT....the audio is hot....hot enough to clip on some repeaters. I see no trim pots and/or other potentiometers in the schematic.

Anybody know if there is a way to adjust the audio without sending the damn thing back to Icom?? Thanks so much in advance!!

1. Is it possible to convert a VHF GE Mastr II mobile unit to repeater operation with 600 Hz separation?

2. Have you done it successfully? If so how?

Our conversion suffers from poor receive quality, either due to poor receiver sensitivity or desensing inside the case.

3. Any experience with this? Remedies?

Hi pete

I could not find a search feature on your web page. There was a long unformated list or index. The folks at QRZ cd-rom have a callsign look up search and they have lots of amateur radio files and programs to down load.

Please provide a service to this amateur community. QRZ does not advertize here....every one links to them on the web! There is room to compete with out filling every radio news group with pointers to your off shore order form. Is it a secure server for credit card info?

You're getting closer. The key to 'low-profile' operation is antennas.
Everything else is easily hidden. But the antenna has to be
electromagentically exposed to the whole world, but visibly hidden from your
neighbors. Quite a dicotomy. I think the terms 'secret', 'covert' or perhaps
'hidden' best describe this type of operation rather than 'low-profile.'
Definitely not 'QRP', as this is already well-developed as its own specialty,
and covert stations may be medium or high power if desired. The best antennas
for QRP use are very high-profile, so there would be an immediate conflict in
trying to include this topic in with the QRPers.

I have duplexed several GE MVPs and have them running as our two meter
main repeater and as our remote sites.

The channel guard switches to transmit when keyed and is deactivated
from the receiver.

As I mentioned, these units are now duplexed.

Is there a way to have the encoder and decoder function simutaneously,
or continue as the decoder on receive when the transmitter is keyed ?

From: wb6wlr@aol.com
Message-ID: <3oiuia$488@newsbf02.news.aol.com>
Source record: 217882

The R7 is a good soultion for situations where you can't use radials. However, any of the better verticals that DO use radials will outperform the R7. My personal preference for a simple multi-band antenna is just a bunch of dipoles, one for each band of interest, all fed from the same point. Works very well, typically 1-2 S-units better that an R7.

In all fairness, I should point out that there are very rare occasions when the R7's lower angle of radiation provide somewhat better signals than the dipoles, usually DX.

One other point...as with ALL verticals, the R7 will be very noisy. It not only is omnidirectional, but its polarization is predominately vertical, the same as most man-made electrical noise (QRN!!!).

Bye the way, I'm speaking (writing?) from experience; I currently have an R7 and dipoles and have had two other commercial verticals.

Hope this helps. 73 de WB6WLR

Pete Rossi (rossi@VFL.Paramax.COM) wrote:
: Would someone please explain to me why you need a synthesized repeater???

: I don't get it. What are you going to do? Change frequencies every
: other week? Seems to me it would be simpler and cheaper to generate a
: cleaner signal with good old fashioned crystals. Am I missing something?

Possible benefits derived from having a synthesized repeater:

1. Don't have to wait for the crystal/channel element vendor to
cut a new crystal (turnaround can be weeks).
2. Don't need no stinkin' crystal or channel element.
3. The repeater could be a spare available as backup for multiple
repeaters (on multiple frequencies).
4. The repeater could be used as a portable repeater for special
events or emergencies so having some frequency agility might
be useful. (Yes, as someone pointed out, the duplexor is probably
not quite as frequency agile.)
5. Its actually punishment for the crystal vendors that can't
seem to get the temp compensation correct on channel elements.

I have a 508 as well, it seems to tune 700-999 MHz on the highest band (except 823-850 and 868-896), though it is easy to pick up cell-phones on the image if you're so inclined. There aren't many services on those bands here so I can't vouch for how _well_ it receives. The stock antenna is pretty much useless in the 150-170 band outside of 2m though, like most of the dual-band ducks I've seen. SMA adapters are fairly easily available for coupling on an external antenna (the flea market lot at Dayton was littered with pieces of cable with SMAs on one end, really cheap).
I'd like to know how to make it transmit below 438 MHz, for possible packet use in the 433 range.
As for batteries, I installed two 850 mAH NiCd's, they can be charged without removing them from the radio through the two contacts on the bottom. You have to cut the plastic off of the side of the bottom cell to complete the negative side of the charger circuit (look inside, there is another contact that touches the side of the cell). That looks like a really neat way to keep from charging non-rechargeable batteries by accident. Battery life with the NiCd's is easily all day scanning, and theoretically according to the specifications a couple of _hours_ continuous transmitting. So I don't know if the extra capacity of the rechargeable alkalines is that useful, unless you're away from the charger a lot. Maybe the unit has a little more transmit power with the higher voltage of the alkalines, but it seems to do OK on NiCds as well. High transmit power is not the C508's forte, although it does hit 440 repeaters a lot better than the 50 mW of my C178.
The block diagram supplied with the unit shows that three-conductor sockets are used for the microphone and speaker, although a conventional speaker-mike with two 2-conductor plugs also works perfectly. The 'ring' conection in the microphone jack is shown going to some sort of power switch, perhaps to supply DC to an external VOX circuit. More interestingly, the 'ring' connector in the speaker jack is shown connecting directly to the microcontroller, perhaps for digital 'cloning' or other programming. Does anyone know more about this?
-Mike

Thanks Mike for that info.
I wish we had 100 of them at Dayton they were THE hit of Dayton.

If anyone finds a NEW dual band duck please post for all.

The 2meter is very poor.

I have called Centurion and Maxrad and NO ducks with SMA.
That should be Dual band ducks.
For now believe it or not the Anli dual is the best as far as not being
a hugh over weight duck.

From: ahusik@pluto.njcc.com
Message-ID: <3ojnbn$4e8@earth.njcc.com>
Source record: 217803

I've read the FAQ about modifying the TH-79 and agree that removing the components to enable wide rx/tx might be a bad idea. I think the 'cutting the green wire' plan seems more realistic, but I'd still refrain from doing this... transmitting out of band is a danger I would want to avoid at all costs. I was wondering if there were any discovered modifications that could be accessed via the keypad. Surely there are 'magic combinations' that can be entered. Any help would be appreciated -

>other week?

What about for an emergency repeater? If one club's system goes down,
you can temporarily replace it with a shared synth one until it's fixed.

Also good for temporary use during an public service event in an area
where the coverage is poor, or as a local repeater to support a disaster?

Yeah, the cans would have to be tweaked, but that's a lot faster than
waiting for new rocks. For temp replacement use, you can just plug into
existing cans.

(Actually, they are probably designed for business band use, where they
can sell and install the thing the same day, without having to wait for
rocks)

3726. New Collins radio equip. to high bidder

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-08 00:00:00 UTC
From: ipdonline@aol.com
Message-ID: <3ok58j$fce@newsbf02.news.aol.com>
Source record: 217809

The following Collins Radio Equipment is going to be sold to the highest bidder on May 10th.
If this equipment is of interest to you, it will be necessary to make your offer by no later than
9:00 A.M. on May 10th. (Pacific Time). These parts are brand new in the box.

1 lot- 14 ea. of HF8014A Collins Exciter PN 622-3473-012
1 lot- 8 ea. of HF8023 Collins Power Amplifier PN 622-3490-001
1 lot- 7 ea. of HF8032 Collins Power Supply PN 622-3512-001
1 lot- 9 ea. of HF8061 Collins Filter Line Flattener PN 622-3497-001

If interested, your offer has to be per lot, not per piece. Example: $10,500 for all 7 HF8032.
This is hi-tech equipment and it brings a premium price. I have seen HF8014A's sell for
$2450 each to overseas buyers.

I also have 2 brand new (in box) Collins RT-980/GRC-171V UHF Tranceivers in my
possession now. PN 622-1628-002. Cost $22,000 ea. in 1992. Buy one or both. Will consider
all offers
over $4000.00 each.

Also for sale by May 10th ---250,000+ New Electron Tubes----Various part #'s and
quantities.
Email list for tubes will be ready by Sunday May 7th.

Call Howard Mullins by phone (209-266-1255) 8am to 5pm M to F or fax (209-266-1254)
anytime for further information. Remember the deadline. Thank you for your interest.

A friend recently picked up a Standard C508 HT, and when I saw its size,
I was truly amazed.

It even runs off 2 AA cells. I was very impressed.

Now, how is its performance? I know Standard is usually good with
unwanted signal filtering.

How about wide-band receive? How modifiable is it? How wide can it go?

Please supply all info, including any mods you may have.

I'd like to add more mods to the oak.oakland.edu:/pub/hamradio/mods

section.

Thanks much!

I picked up a box of MVP CG boards at a hamfest last year (sans versatone elements... sigh!), hoping for the same. Unfortunately this isn't possible: as I remember when trying to use one on a new repeater project the PL Decode activity line went active (and stayed there, or at least falsed on and off) while the unit was encoding tone. Half-duplex tone operation only I'm afraid- unless someone has scratched their head longer looking at the schem. than I did (I had other boards available- so KISS dictated to use them instead).

Unfortuanately for use shoestring-budget-amateurs, Comm Spec's Ts-32 board is still the most available , cheapest board capable of constant, simultaneous encode/decode (granted the same tone is used for both functions). At $58/ they are do-able but rack up quick with multiple decoders, remote receivers, links, etc.

Dear fellow radio enthusiasts,

I was lucky enough to spot two mil spec radios, Model PRC-25, at a surplus store in Kitty Hawk, NC. They seem to work fine (could receive cable TV leakage - TX in 6m band showed on the meter).

Does anyone know what the specs are as far as power out, tone squelch, etc? Also, does anyone know where I can get spare JAN-2DF4 tubes? I assume they're used in the receiver - I fired one up w/o it and got no signals.

Thanks in advance,

Heck, just make your own. I did, it cost less than 5 bucks. You just need
a cigarrette plug, some wire, a power plug, and maybe a filtering capacitor.

That's assuming that the TH79 has some kind of external power jack. I'm not
sure, but I'm guessing it does.

The 2:1 bandwith of a vertical antenna is inversly proportional to effeciency,
eg. the higher the effeciency, the narrower the bandwidth. Also, the bandwith
is related to the band vs. the physical size of the antenna, eg. don't expect
wide bandwidth on 40 or 80 meters with a 26 foot antenna. I've used Butternut
HF6V and HV2V for years at ground level with no radials, just an 8 foot ground
ro. The SWR curves look great but most of the power heats the ground. It's
probably better to use radials for effeciency and a tuner to keep the
transmitter happy.

3745. Dual Bander Mobile Suggestions Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-08 00:00:00 UTC
From: kucharsk@nessie.dr.att.com
Message-ID: <D8A29p.B0M@bigtop.dr.att.com>
Source record: 217828

Well, it's finally time to get that dual bander. I had planned on doing
this last year, but never quite got around to it. I had pretty much settled
on a Yaesu FT-5100 (I love my 411E HT), and like the backlit mic, but I thought
I'd double check current recommendations. In "second place" on my list are
the Icom 2700 (too many cold solder problems), and the Kenwood TM-733A
(need an external duplexer.) The new Yaesu FT-8500 looked quite promising
unitl until I saw the mic from hell. :-O

Thanks in advance...

(On a related note, anyone out there have any hints/tips/experience
installing a mobile rig in an 89 Ford Probe GT?)

Hello all!!

I was wondering if there is anybody out there that has attempted and/or successfully completed the Expanded RX/TX mods for the Icom Delta-1. I aqcuired the info on the mods and the parts, opened up the radio and (think) I've identified the parts to remove/replace but need more info and advice.

Any info, advice, and/or comments would be appreciated THROUGH EMAIL at: lkawamot@w6bhz.calpoly.edu Thanks in advance

3752. Alinco DR-610T

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-08 00:00:00 UTC
From: lkawamot@galaxy.csc.calpoly.edu
Message-ID: <3on0l9$871@galaxy.csc.calpoly.edu>
Source record: 217835

Hello all, I am currently looking at the Alinco DR-610T as a new mobile rig for my set-up and was wondering what other people thought of it. I currently have a Yaesu FT-5200 in my car -- I like it, but it's time to replace it.

So, if anyone can help me out with good points, bad points, etc I'd really appreciate it. I was originally looking at Kenwood's TM-743 (?? I think that was the number) but after talking to several friends decided against it. I guess that my questions (mostly) are:

* How well does the DTMF remote control work? (Does it have the same problem as the Kenwood's 'constantly hot mike'?)

* Can it crossband repeat? If so, does it have a 'hot' mike?

* How many sets of cables need to be run inbetween the face plate and the actual unit for remote mounting?

And I guess any additional comments will be appreciated. Thanks in advance and I'd like any info to be sent to me via EMAIL at:
lkawamot@w6bhz.calpoly.edu

Keith

9 band version in use here for over 10 years. Figures are for 2:1 VSWR
points.

160 20 khz
80 60 khz
40 300 khz (almost the whole band)

30 through 10 meters(including WARCS) the entire band can be covered in
each case. If you get wider bandwidwiths on 160 through 40 than I have
shown here then it is likely that your ground plane is not suffiecient. I
have had my best results in the past with at least 2 (4 prefrred))
resoanant, elevated radials for each band. If you ground mount the thing
then plan on spending more than just a couple of weekends burying wire in
the yard if you want any real effeciency. Most recently I moved and was
blessed by the pressence of a 15' high 30' x 40' steel barn already on
the property. The vertical mounted in the middle of the roof of this
structure performs admirably with out radials, using the steel barn roof as
the counterpoise!!
As for the phone number it used to be in QST all the time, but I just
looked in a recent issue and it's not there. Check your back issues in
the advertisers index, It could be they don't advertise every month they
are located in south Texas somewhere.

good Luck
Dave

Steve

In general across most all news groups on the internet(not just rec.radio.whatever) it is considered bad "netiquette" to use the public forum for commercial advertisements. There are a few exceptions for example over in the real estate areas. The best advice is to get a copy of the FAQ for any newsgroup before making a questionable posting. If the FAQ does not specifically allow (or disallow) commercial posting then ask first rather than jump in and wait for the "flame throwers"!

Welcome to info hiway amigo!
See you in the pile up!

Ch> -chris

I'll look these up at work. Do you know what the radio is programmed
for? Having the pinout for the mic plug is useless unless you have the
RIB interface and M216 adapter. These are only available to Motorola
service centers.

```
Q I've read the FAQ about modifying the TH-79 and agree that removing the
Q components to enable wide rx/tx might be a bad idea. I think the 'cutting
Q the green wire' plan seems more realistic, but I'd still refrain from

If you (anyone) want to use the wide-rx option of this rig, cut the green
wire and operate a wide-tx enabled radio with your own risk. If you want
to do the hardware mod to enable only wide-rx, let a professional surface
mount component facility do the job. Components in the radio are the
smallest size SMC, and very difficult to modify without experience. It
won't cost a lot.

Or even just the schematic. I got a "sick" one locally, just the ticket to give me something to do when the bands are dead. I got no manual, and looked at an R4 manual, and the R4C manual, and the tube complements are very different. Looks like I really need the R4B manual or schematic to handle this.

I want to try just re-tubing it first. It has very low sensitivity, that is the only problem I can tell. Sounds like it should be a simple problem. Keeping my fingers crossed. I would love any advice or counsel, too....

I need the manual/schematic, and any of the following tubes, good-used are fine!

(3) 12BA6
(2) 6HS6
(1) 12AX7A
(1) 6EH5
(1) 6BZ6
(1) 12BE6

And, if anyone has the time/inclination, if you know, could you tell me which tube is which function? I believe the 6BZ6 is the RF amp and is suspect, but the IF amps would also be likely sources of the problem.

Source record: 217748
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.swap

I just picked up a Tektronix model 2213A scope for a bargain basement price, knowing it would need some repair. Specifically, there's a bad distortion in the trace at about 80% of the way up the trace, and a smaller distortion about 20% of the way up (from the bottom). If you're displaying a flat trace, and move it up and down, you'll see the flat line distort at these points.

My guess is that this is probably a sign of something wrong with the CRT deflection plates, though I hope it is something cheaper!

Anyway, Tektronix wants $355 flat rate to repair and calibrate <plus> $750 if it needs a CRT, and I'm wondering if anyone can suggest another repair place that might be a bit more reasonable -- particularly if they can replace the CRT for less. For the money I have in the unit, spending a few hundred dollars is reasonable. Spending a grand is out of the question.

Thanks...

3768. PK-900 software ????

CQ Netters...

A friend owns a PK-900 multimode TNC, he is very happy with
it's performance but he never manages to work the FAX mode ?!
From the looks of things the software supplied by the dealer
does not support or better yet does not recognize the FAX
hardware of the unit !! The software used is the same software
used by the PK-232.
When the dealer was contacted he said that the models are
more or less identical (most propably less) and the software
should not make a difference !!
Does anyone out there have the same TNC ? What software should
be used with PK-900 ? any freeware available ?

Please reply via e-mail to demetre@intranet.gr TNX

3769. Q: Marine Radio Freq's?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-09 00:00:00 UTC
From: P22407@email.mot.com
Message-ID: <1995May9.180333.27176@schbbs.mot.com>
Source record: 217752
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I am in the market for a marine VHF radio for my watercraft, but all
the catalog says is that they are VHF, and that they recieve 88 chanels and
transmit on 57 channels. What I would like to know is:

? What is the specific frequency range of typical marine radios?

? Do they transmit/recieve in AM or FM?

? What is the frequency spacing of the channels?

The specific brands I am looking at are Icom, Apelco, Humminbird, and
Shakespeare.

I would like to apologize in advance if this is not the correct forum
for these questions, but I am rather new to this.

Any info is apreciated.

3770. Yaesu FT840 Rig Control SW? Help

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-09 00:00:00 UTC
From: brunelli_pc@delphi.com
Message-ID: <hqy+6J8.brunelli_pc@delphi.com>
Source record: 217753

My dad has an ft840 and was aking me, the one with all of the analog gear, what rig control software was available. A stand alone control panel would be great, but a logger with rig control would be ok also.

reply here
pete, n1qdq

: find it to be easy to use and it is not expensive. It is full featured
: and upgrades, also inexpensive, come about once a year. Support for
: questions or problems is excellent

: 73
: Ron WB4RUO

I agree LOG-EQF is quite good. But then there is Ham Log 3.1 by VK2VN which is professional and reviewed as...

On version two, Len Shaw editor of Amateur Radio Action wrote:
"The author has gone considerably further (on features) than in any log program... ...you are unlikely to find a better log-keeping program anywhere. Having seen and used a wide variety of shareware and commercial programs, I believe this one to be excellent value for money... I would say the same if it was double the cost." On v.2.4: "The Best Gets Better".

In France's Megahertz: "Installation: Easy! ...neat professional which remains simple to use".

On version 2.5 The Canadian Amateur magazine wrote:
"This is the first program I have used in years that I really cannot find anything to improve on."

Now, there is version 3.1 of Ham Log. (Functioning version available on the Internet - HAMLOG3.ZIP at oak.oakland.edu) Give it a go, you will be pleasantly surprised.

73,

Robin Gandevia VK2VN

AEA DOES make one for 440. I have one and it works great! Look again.
Order one out of a catalog somewhere (Tuckers has them) if your favorite
store doesn't have it.

While you had the radio open, did you notice an area of the circuit
board that was not populated with parts? If so, you have a post-ban
rig, and the RF electronics aren't there to allow 800 MHz operation.
Jumper 13 will still let the microprocessor think it's tuning 800 MHz,
but the actual electronics to do it are missing.

Gary

>
>What is the definition of a decibell as in a 3 dB gain?

dB is the abbreviation for decibel which is defined to be one tenth of a bel. A bel is the common log of a power ratio, IE

bel=log(P1/P0) and dB=10*log(P1/P0)

so a 3 dB gain is equivalent to a power ratio of 2, IE

P1/P0=10^(3/10)=2

so an amplifier with 3 dB of gain outputs twice the signal power put into it.

When talking about things like antennas, they obviously can't put out more power than what goes into them, rather dB in this case refers to the power they emit in some specified solid angle (called ERP) compared to some other reference antenna, usually a dipole or the theoretical isotropic source. So, for example, some antenna may be said to have 3 dB of "gain" over a dipole. What's usually left unspecified is the solid angle over which this is true. An antenna develops "gain" by robbing signal from some directions and concentrating it in another direction.

> After all, those things were just about made to be modified!
>

True, Why bother... but if you want to unmodify it, crack open the
case. Take off the top half. (BE CAREFUL) the speaker wire is
connected to it and you don't want to mees that up. (Just take off the
cover slowly.) Next look at the front of the radio (by the display
pannel) There will be three sets of jumpers. One toward the left side,
one in the middle and one towards the right. I believe the one on the
left hand side (looking at the display pannel straight on the side on the
left I am calling the left hand side) Anyway, the jumper setup will be

three prongs and the jumper covers two of them. Leave that one the way it is. Now in the middle there are four prongs with the jumper covering three of them. Move the jumper to the only other possible position. Do the same for the jumper on the right side. (this jumper should have three prongs).

Travis

PS I might be backwords on the left and right... it has been a while since I modified my RCI 2950.

>unitl until I saw the mic from hell. :-O
>

I ended up purchasing a Kenwood TM-733A at the Dayton Hamvention. I also purchased the kit to mount the radio in the trunk and the control head on the dash. The 8500 was out simply because
of the mic. If the mic had a frequency display like the standard, then I would have probably gone
for the rig. My feeling was that I still had to have the display mounted somewhere I could see it.
I'm very happy with the Kenwood. I have some friends that bought the Yaesu 5100 and ended up
with the TM-733A due to Intermod in the Indianapolis area. It doesn't seem to be a problem in
all cities. If you are crowded for mounting space, you might take a look at the Standard dual
band that has "everything" in the mic. I've talked to operators of the Standard rigs and they have
excellent intermod rejection.

I have recently purchased a Kenwood TS-520SE. My local library has some back issues of QST, and I have found out that the 520S was introduced in 1977, with the addition of 160m, improved speech processor etc. over the standard 520. Selling price at the time was $650. Unfortunately, the issues that would cover the introduction of the 520SE are missing. Does anyone know what year(s) the SE was produced? What was the improvement over the 520S? What was the selling price?
Thanks,
Chris

I have applied the "jumper 13" mod to my 530 that now allows me to
"tune" frequencies between 800 and 950MHz. However, I cannot receive
even the signal generator next to me on the bench.

I assume there is another jumper to allow reception in this range?
The ECPA cops at work again??
Did others have to mod their radio to allow this coverage?

My radio has jumpers on pads 1, 3, 6, 8, 11, and 13. How does this
compare with those of you able to receive 800/900MHZ stuff?

3787. Icom U16 HT Programing Help Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-09 00:00:00 UTC
From: leigh@rain.org
Message-ID: <3omjss$rhl@news.rain.org>
Source record: 217770

I'm trying to help a friend program ham frequencies into a newly acquired
Icom U16 HT. It has a few commercial freqs in it.

Thus far we can't change the commercial channels. I FTPed a U16 file
from the oak.oakland.edu radio mod database, which seems to contradict
itself. (It is listed below.)

Questions:

The file implies that the U16 must have a jumper in a certain spot, in
order for it to be user-programmable. Where should this jumper be?

The file contradicts itself: when a new frequency is being inserted,
should it be entered as five or six digits?

What are the keystrokes required to enter a typical ham 70cm repeater?
We can't get it to accept a new frequency using the data below...

Thanks in advance and 73 from Leigh/KM6JE in Santa Barbara.

3788. Yaesu FT-2200 or 7200 Mod & Use

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-09 00:00:00 UTC
From: Andrew Daryl Gungadoo <gunga@andrews.edu>
Message-ID: <3omoe7$e67@orion.cc.andrews.edu>
Source record: 217771

I just bought a brand new Yaesu FT-2200 at the HamVention in Dayton
and would like to know a few things about it.

1) Does anyone know the use of the (P) button on the Mike (MH-27)?
2) Can frequencies be entered using the DTMF keypad on the mike ?
3) Are there any mods for the radio (i.e. Aircraft Xmit)
4) Has anyone used the digital voice recording; is it worth it ?

3789. Re: Icom U16 HT Programing Help Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-09 00:00:00 UTC
From: gfiber@halcyon.com
Message-ID: <3omqp8$5pr@news.halcyon.com>
Source record: 217772

In article <3omjss$rhl@news.rain.org>, leigh@rain.org () says:
>
>I'm trying to help a friend program ham frequencies into a newly acquired
>Icom U16 HT. It has a few commercial freqs in it.
>
>Thus far we can't change the commercial channels. I FTPed a U16 file
>from the oak.oakland.edu radio mod database, which seems to contradict
>itself. (It is listed below.)
>
>Questions:
>
>The file implies that the U16 must have a jumper in a certain spot, in
>order for it to be user-programmable. Where should this jumper be?

3/4 way down the left side of the logic board which is inside the front cover.>
>The file contradicts itself: when a new frequency is being inserted,
>should it be entered as five or six digits?

The frequency must be inserted in six digits. The decimal point must return
to be a valid frequency entry. Also you must hold the function button while entering the frequency and
then press enter before releasing the function buttion.

>What are the keystrokes required to enter a typical ham 70cm repeater?
>We can't get it to accept a new frequency using the data below...
>
>Thanks in advance and 73 from Leigh/KM6JE in Santa Barbara.
>--
>copied from the Internet:
>From: rosenblg@cmcl2.nyu.edu (Gary J. Rosenblum)

>Function + 159357 (Enter program mode)

if the jumper has been removed a colon will now show up between the Ch and channel number
ex Ch 01 with jumper removed Ch:01. You have only 30 seconds time between
entries or the radio will time out and return to operation mode.

From: starr@deltanet.com
Message-ID: <3omtns$jpt@news2.deltanet.com>
Source record: 217773

There are no known keypad modifications. If you want out-of-ham-band receive, do the official Kenwood "cloning" mod. This mod enables the clone feature and allows wide-band receive, but not out-of-band xmit.

: Believe "S" signified digital display. "E" includes heater switch
: and perhaps other stuff.

Alas, the 520se had neither. The main changes over the 520s were DECREASED 80m sensitivity and elimination of the mobile power supply and transverter jacks.

In effect, a "simpler edition" of the 520s.

Used they currently go for $400(US) (asking price with a 30 day warranty) to $200 (swap net special).

3796. Is there a 1/2-wave for 440 HT's?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-09 00:00:00 UTC
From: zilch0@primenet.com
Message-ID: <3on359$reb@news.primenet.com>
Source record: 217779

I really like the AEA HR-1 telescpoing half-wave for my 2-Meter HT and I know they make one for 220. AEA doesn't make one for 440 and I'm wondering if anyone does. I'm talking about a rubber-ducky replacement that mounts on the HT's BNC connector. I don't care if it's telescoping -- a flexible ducky is OK as long as it's a half-wave design. Any suggestions?

Thanks, very much, in advance...

: The recent talk on Yaesu FT-51R cloning port and software
: prompts me to ask, does the FT-530 have similar capabilities?
: I've not seen anything in the mods file, and the manual makes no
: mention of cloning, BUT there is a clone output marked in the
: schematic (it's the middle terminal of the speaker out jack.)
: Does anone know about cloning or PC download capabilities for
: the FT530?

: Jerry, KO6JV (Sacramento CA area)
: Jerry_A_Kreifels@ccm.fm.intel.com

: "My opinions, not my employer's."

The FT-530 can be connected to a serial port for both upload and download, BUT JUST TRY AND GET THE INFO FROM YAESU! I read an article in *World Radio* about 1-1/2 years ago, where a California-based Yaesu rep was quoted as having bragged about that feature. His name was given in the article and I pursued it. I can't remember his name right now, but could get it if I had to. I tracked down his phone number and spoke to him about the article. He admitted that the capability is there and that it's used all the time to save customer's programming when rigs are brought in for repair. They also upload a standard set of frequencies for testing the rig during repair efforts, then restore the customer's orignal programming. He told me that he had to prepare some docs on how to do it, that he had had several requests and wasn't prepared to publish anything. I called him at least 8 times across the following two months and only found him increasingly hostile and evasive, so I gave up.

I have conjectured that he got his hand slapped for opening his mouth about that feature they may not care to support. He never said he wouldn't get back to me, he just didn't.

Happy hunting! Let me know if you learn anything else, please. Thanks,

Hi OMs
I ever thougt, im a poor guy with my 6 meter wire matched under the roof.
This was a fault!
now the owner of "my" house has isolated the roof with rockwool/alumina
and so there is no way to use my old wire any more. Lost about 5 levels
on my s meter !!!!
So im interested in your experience with magnetic antennas for all bands,
and especially with convoluted loops. I have a little programm for magnetic
antennas and on the lower bands a convoluted one seems MUCH better (i.e
20% effiency of convoluted loop to 8% normal loop both with 2 turns and
6.5 meter copper on 80 meter).
I am interested too in solutions with remote tuning of these antennas, because
i want to use them under the roof.
73 and always good dx de

3808. Para Dynamics PDC9 SWR/PWR meter?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-10 00:00:00 UTC
From: fonga@silver.ucs.indiana.edu
Message-ID: <3opkvn$lch@usenet.ucs.indiana.edu>
Source record: 217699

I purchased a Para Dynamics PDC9 SWR/PWR meter at the
Dayton Hamvention. It is the VHF/UHF model which has
two power ranges: 15W and 60W. Well, it seems to have
a problem measuring reflected power. I'm not getting
any reflected power at all no matter what antenna
I hook up to. My guess is that one of the detector
diodes is blown or defective. I've opened the unit up,
and everything looks nominal to the naked eye.

Problem is, there is no address for Para Dynamics anywhere
on the package or on the sheet of instructions. The
only clue is a "Made in Korea" on the back of the package
next to the specs. Does anyone know how I can contact
this manufacturer?

Please respond by E-mail, as my net access is by long-distance
land line, and I don't get on here too often.

$75.00

H-P 606B Signal Generator
50 KHz to 65 MHz
Clean and in excellent working order with manual

$150.00

H-P 608E Signal Generator
10 MHz to 480 MHz
This is one of the cleanest 608s I've ever seen, excellent working order with manual and some spare tubes.

$ 175.00

Tektronix Scope-Mobil 202-1
Perfect fit for the H-P 608 or 7000 scopes.
Clean with one storage drawer.

$ 65.00

The 606 and 608 are large, labratory grade instruments and the scope cart is bulky so local pick up only.

This seems to be the best suggestion. I would definitely be interested
in subscribing. Such a mailing list should have some provision for a
daily digest as well, since some of us simply cannot receive many
messages daily without attracting adverse attention. (How about another
list called Internet.e-mail.low-profile ....!

>With well over 7000 newsgroups some sites may have reached the saturation
>point and choose not to subscribe to the new rec.radio.amateur.low-profile.

This is also a valid point. I'm pretty sure that I would not have access
to such a specialized newsgroup through my present means of access.

This is a warning to any and all fellow hams considering the purchase of a Kenwood with a removeable face. This may apply to other manufacturers, too....! Kenwood DOES NOT SELL THE FACEPLACE SEPARATELY. When I had mine stolen I had to go through an awful time, and ended up buying a whole new radio (Kenwood again...mistake) and keeping my old xcvr as a spare parts box.

There is something wrong with buying a ham radio from a company which also sells bread makers, cd players and rice cookers.

Feel free to respond here, or directly with me at:

> over the 520S? What was the selling price?

The earliest advert I can find for the SE is January 1980 in Radcom. Then it was on sale at 485 UKp (including the fan, a big selling point against the FT101Z series!). As far as I can see from this advert the only difference from my own 520S is that the SE can't be converted to 12v operation. The S version is prewired for an optional DC converter, although a large power supply or battery would have been needed as it draws 15A on transmit (park on a hill). Otherwise they seem to be identical.

I have been looking at various radios which are Marine SSB certified and which are capable of being used as a HAM radio. After much agonizing I finally settled on the SG-2000 with the SGC external tuner. I recently placed my order after talking to most of the vendors in QST and other ham rags who without exception suggested the rig for my application even if they did not sell it themselves.

At any rate, I just was informed of some comments which had been passed around about the reliability of this radio and I am wondering if anyone has any knowledge. Especially first hand about this radio.

You can not get round this problem (me-thinks!)
Memory 9 is a read-only memory or write- from- air- only memory.

Memory 9 keeps a tab on the last DTMF tones *heard* over the
air! Get someone with another DMTF H/H to xmit the number to you. ;)

John.

>
>
> Nick
>

The Radio Shack DSP filter is a TRUE DSP filter, just not a very
sophisticated one. It uses an FIR algorithm for the removal of
pure and near pure tones and out-of-bandpass frequencies.
It just has no noise filtering despite what the front panel and
owner's manual say. The "20db" noise reduction is the result
of the narrow bandpass, the average noise reduction from
"DC" to 5Khz is 20db. The "missing" DSP chip is because the
DSP chip that is used is a custom chip for that filter and the
one DSP CB that Radio Shack sells.

I'd say a lot of the decision depends on what you plan to do with it. If you are going to check into nets and sometimes talk with your buddies, any one of the three will do just fine. If you plan to *ever* use it to act as NCS on a net, look at the heat sinks and *nothing else*. The 2700 has a heat sink that is larger than some entire radios. The 5100 and 733 have tiny, dinky, do-nothing heat sinks with asthma fans (couldn't blow out a lit match, heck, couldn't even make the flame flicker). Yeasu & Kenwood tech support say that if you are going to use the 5100 or 733 to run a net, then put an external fan blowing lotsa air across your rig. Icom doesn't need one. Just my $0.02 worth.

Memory 9 did turn out to be ROM. It is neat to watch the DTMF codes being sent
getting decoded in real time. To do this, one must be in message mode and have
the DTMF auto-dial memory #9 displayed on the screen.
Thanks for helping me with this undocumented feature.

3835. Need source for NiMh AA cells & Charger

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-10 00:00:00 UTC
From: dgf@netcom.com
Message-ID: <dgfD8D8u8.Bxy@netcom.com>
Source record: 217726

I am still trying to find a source for AA-size NiMh (not NiCd) cells
and a suitable recharger. I called "Battery Tech" and they said not
available for several months, but I think I saw these for sale elsewhere
even a year ago. Anyone have a lead?

Thanks,

73 Dave WB0GAZ dgf@netcom.com

3836. Older Gear

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-10 00:00:00 UTC
From: tschuld@gpu.srv.ualberta.ca
Message-ID: <3oqine$7g6@rover.ucs.ualberta.ca>
Source record: 217727

Are there any resources available to learn about older amateur radio gear? Someone mentioned to me a boat anchor's mailing list. Are there any publications other than old issues of QST? How does one subscribe to the mailing list? I am particularily interested in Drake and Collins, but other stuff as well.
Thanks,
Chris

3837. Tell me about your mobile dual purchase..SUMMARY of responses

I was asked to repost replies to my request on advice for mobile dual-banders; here 'tis! Thanks again to all who offered help. We still haven't bitten -- we'll wait to buy 'em until after my wife passes her Tech, so if you have something to say about your dual-bander, please email me!

John:

Our club here at work bought such a rig to use for an emergency communications setup (i.e., there's an earthquake, the phones are down, and we need to call for a fire truck; (we're out in the country))

Our primary consideration was ease of use, as we'll probably not use this radio very frequently, so we needed something we could figure out without a manual, at least for the basic stuff.

We wound up getting an ICOM IC-2340H. It also has the attraction of the ICOM service center in nearby Bellevue, WA.

The radios we looked at were:

Icom IC2340H, Yaesu FT-5200, Standard C5718, and Kenwood TM-733A.

We've only had the ICOM for a couple of weeks, but so far I really like it. It's relatively easy to use, the duplicated controls for VHF and UHF make it

easy to tune and control. We are also across the street from a fairly high powered UHF pager transmitter, somewhat notorious for causing intermod problems. We haven't yet heard any intermod of significance on the ICOM from it.

A personal note on the Kenwood: playing with it in the store, I got it locked up solid, just trying to tune to a memory channel. So locked up that the salesman had to cycle power with reset depressed to unlock it! I did not find it's user interface at all intuitive.

The standard was also fairly unfriendly I thought; *All* the controls are on the microphone, and I just looked at it in confusion for a minute and put the mike down.

I did a score sheet on the radios we looked at, and here it is:

Wt Icom Std Yaesu Kenwd
3 Ease of changing bands 4 2 3 3

3 Ease of recalling and setting memories 4 1 2 1

3 Ease of direct entry of frequency (VFO) 4 2 3 3

3 PL tone stored with memory channel 4 4 4 4

2 Automatic determination of repeater 4 ? 4 ?
splits with frequency

3 Ease of going simplex 3 2 3 2

1 Back-lit keys and functions 3 2 1 4

1 Head set and mike

2 Ease of power output change. 3 3 4 4

3 General ease of control use. 3 1 3 2

1 Dual in-band recieve (listen to 2 2m 0 4 0 4
channels or 2 440M channels at once.)

1 Auto-mute of un-selected band 0 4 0 0

2 Built in diplexer 4 4 4 0

Score: 87 64 75 65

Hope this is of some use..

I just went for the Standard 5718. I really like it; especially the way that you can control the entire rig from the display mic. When parking on the street, I just put the mic under the seat with the radio and no one know's it's there (besides the antenna on the car). The expanded receive is the widest on the market and the thing is packed with features.

[3]

Hi David. I have two Yaesus mobile dual banders, an older FT-4700 and a newer FT-5200, both in current service. I choose them both for the remote mount capability of the front panel. It is the only way to get both bands neatly installed in a modern auto with a center console. It allows for a real slick installation. Both rdios have been flawless. The 4700 is mores than 4 years old. The 5200 is about 18 mos old.

I have heard that the Alinco radios are very subject to intermod interference. I can tell you that the Yaesus that I own are not immune either when in high RF areas such as NYC. Some of the dual banders need an external duplexer if you plan to use a single dual band antenna. That costs about $50. The 4700 needs one, the 5200 has it built in. There are pros and cons to both scenarios. If you wish to run an amp on only one band, the external duplexer allows you to do that in only one bands feedline. If inetersted in that, be sure to get a duplexer and antenna of suitable power. There are some dual band amps, but mostly lower power than I usually use. I prefer the Diamond line of mobile antennas.

Good luck,

Tom
K2CZ

---

[4]

I have Kenwood TM742. I bought it because I already own a Kenwood TH78A. Also, a bunch of my friends also have Kenwood; that makes it easier to learn from each other.

In general, I like the radio. There is no particular point I dislike about it. I live in L.A. Intermod is generally not a serial problem for me, may be I am not in the most series area. When I do experience intermod it is generally in the 440 MHz band.

One nice feature about TM742 is that you can add a third band, such as 220 MHz, 50 MHz, or 1.2 GHz.

David,

I will tell you about which radio to purchase but please send me all you comments because I am also interested on what others have said.

Personally I would purchase the Yaseu FT 530. The Kenwood TH series has great audio and features however it is a bit finnicky and not very robust and Kenwood is very expensive to repair. The Icom W21A has lousy audio but a very capable rig. Good receive capabilities form about 100MHz to 900MHz.

The Alinco is also not a bad piece of gear however the current models do not seem to be put together as well as the others.

Regards,

Len Spain

Subject: Re: Tell me about your mobile dual purchase...I'm looking

David,

I'm using a Kenwood TM-731A. I've only had one problem with it that I hope is cured. If I needed another mobile rig I would consider another Kenwood. If you need a Duplexer I recommend a Larsen. If you purchase a duplexer, especially a Genisys, I would check it against it's performance specs.

If you're thinking of using DSQ encoding/decoding check to see if any repeater you might be using will pass the DTMF tones. The ones around Kansas City often do not. The repeaters I worked on decoded the DTMF,filtered it out, regenerated it cleanly to the phone lines, then kept it from being re-transmitted. Not only did this give more reliable switching, it keeps those monitoring from decoding DTMF phone numbers.

Good Hunting,
de N0USP

Michael Black (Michael.Black@juxta.mba.org) wrote:
: Visor@globalcom.net brings up the point that he remembers that the S38 did not have a BFO, but provided a beat by putting the IF into oscillation.
:
: I think he's right. I recall seeing things about this; I seem to recall seeing at least one article on upgrading the S38, and it included adding a separate BFO.
:
: But if I am remembering this right, then I also remember that the S38A did add a separate BFO, for what it's worth.
:
The original S38, the one I have, has a separate BFO stage. It is a SIX tube radio as opposed to the american five. the output stage is a 35L6 instead of a 50L6. There is a BFO control on the front panel. Later versions did not have one. The date on the manual for my radio is "August, 1946."

The complete tube complement for the S38 (no suffix) is:

12SA7 Mixer-Oscillator
12SK7 IF amplifier
12SQ7 Detector-1st audio-AVC
12SQ7 BFO-Noise limiter (yes, there is a noise limiter switch on the FP)
35L6 Audio output
35Z5 Rectifier

I didn't see the Radio Shack HTX-202 in your list. Consider it. If you get one of the new-fangled handi-scratchies with the receiver that covers DC to daylight, you can expect to hear GOBS of crap in the receiver that has nothing to do with amateur radio, especially at 5,000 feet above an urban area.

73 and congrats on the new ticket.

Is there anything special about Kenwood's interface for RS232 to
do remote control on a TS850S?
Looking over the pinout, the standard serial lines are all there,
is it just a cable/connector situation? Or is adapting those serial lines
on the rig necessary (to bring them to RS232 level)?
Is there a FAQ/info sheet on this maybe?

Just wondering -- so I don't have to spend the $ on the actual
McCoy if I have to..

All,

I am selling my PK232 MBX Multilmode Controler from AEA for $75.00 plus shipping. It is in good condition, but missing some of the screws to the top cover do to replacing the lithium battery. It works great. I used it only for SWL reception a few years ago. I thought I may need it and hung on to it for all these years, but as you can see I no longer need it based on this post.

Thanks,

Gary G. Herbst

All that is needed for a group to form is 100 more yes votes than no votes.

>In the past 3 years every time a suggestion was made to shift from an email
>list to a newsgroup the suggestion was always vehemently voted down.

And why I am not a member of the mail list ... (There is a hint in there).

>If the low-profilers want a group, then why not start an email list?

Because, the defined message of the low-profilers requires some active
information retrieval, something a mail list can not provide because of
it's more obscure nature. I do not support the low-profilers group because
it heavily overlaps the r.r.a.antenna group, though ...

>Such lists are very very successful, for they target a select-interest
>group and as a result the noise level is quite low (no flame wars).

You mother wears army boots, and dresses you funny.

>With well over 7000 newsgroups some sites may have reached the saturation
>point and choose not to subscribe to the new rec.radio.amateur.low-profile.

Even though I do not support the group, I would be pleased to distribute it
despite the 7000 newsgroup saturating my disk transfer statistics ...

From: Norm_Beasley@sil.ORG
Message-ID: <01HQB05WRS3U000A1G@SIL.ORG>
Source record: 217793

Fellow Hams,

I have use of a Standard C150, 2 meter handheld for a short while. It belongs to a friend of mine, P29KRW, who is "out bush" for a while. I am wondering if this particular radio is capable of having its receive frequency range expanded to include 136MHz to 174MHz (or greater, would be OK too). Does anybody know?? The radio was originally purchased in Australia. I have noticed some of the US ham magazines show an add for the Standard C158. This radio appears to be very similar to the C150, judging by the front panel and advertisement descriptions.

I have tried several combination(s) of switches held down and turning on the power, but nothing seems to do the trick. Any help would be appreciated.

Being over here in Papua New Guinea, we seem to be out of the beaten path for this kind of information.

Thanks in advance....

From: Norm_Beasley@sil.ORG
Message-ID: <01HQB05XSR4E000A1G@SIL.ORG>
Source record: 217794

Dear Fellow Hams,

A friend of mine, Ross, P29KRW, has recently purchased an Icom IC-707. He is wondering if the radio could be mocified to include general coverage transmit. Has anybody out there made this modification to this particular model of radio?? If so, how? Any help would be appreciated.

Ross spends a fair amount of time "out bush" as a linguist/translator in fairly rugged conditions, here in Papua New Guinea. He does have and use am older Codan commercial frequency radio for 2.840 MHz frequency. He does take the IC-707 out bush with him, partly to keep in touch with family and friends, but would like to make the modification to use the Icom as a back up to the Codan, if it should fail.

Any help would be appreciated....

Thanks in advance.

3850. Re: Q: Marine Radio Freq's?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-10 00:00:00 UTC
From: SHHW94A@prodigy.com
Message-ID: <3op0e6$q70@usenetp1.news.prodigy.com>
Source record: 217795

Dave, I can help with some of your questions.

Marine VHF is FM, Frequency range is from 156.05MHz (CH 1) to about 157.425MHz (CH 88)for ship transmit and from 160.65 to 162.55 for coast station transmit.

Spacing seems to be .05MHz. Some channels are simplex and some are duplex (usually the Marine operator and international channels). A few channels are receive only (weather and CH 15)

Hope this helps. The handbook which comes with your radio will list all channels and modes.

Jim

3851. Morse code programs and FAQ request

3852. Questions on Dentron 1200 L linear

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-11 00:00:00 UTC
From: "F. Kevin Feeney" <fkf1@cornell.edu>
Message-ID: <3ot99f$d6m@newsstand.cit.cornell.edu>
Source record: 217647

Hi,

I've recently bought a used Dentron DTR1200 L amplifier and have some questions about it.

1) Does Dentron still exist? I can't find it in the advertisers indexes in the usual magazines. Some of the Ameritron gear looks similar, and is Ameritron related to MFJ? (Clue, I've always been a 'barefoot' kind of guy - so I haven't paid a lot of attention to the amplifier world)

2) Does anyone know how the 10 meter mod is done? This one wasn't modified, and if Dentron isn't still around I'll need to get the data someplace. Will I need switch parts?

3) Realistic output levels? It talks about a kilowatt or so input, I'm presuming that the output will run 500-600w - which is all I'm really looking for, 6 db or so up from my regular output of 100 watts and let the exciter loaf at 10 watts on SSTV.

4) I'm curious as to whether this amp can switch quick enough to use for PACTOR. I mostly run barefoot at 25 watts or so for that mode, but sometimes it would be useful to run some more (again, I'd probably let the exciter loaf and only run about half power). I don't think I'd run it with AMTOR, as that switching cycle seems like it would really be rough on relays, but PACTOR doesn't seem quite so bad. I haven't had the case off yet - does anyone know what kind of relay is used for switching?

I have no idea how common this amp was. It seems about the same basic design as the SB200, a pair of 572's run grounded grid, but seems better built and the price was right. Any info on it would be greatly appreciated.

TIA

73 de Kevin, WB2EMS

Dave, I'd try Kenwood....they may sell some "touch up paint" in a small
bottle like the auto industry or appliance industry does.

If not, go to a large auto parts store and look at the touchup bottles
and perhaps there will be a near match to the color you need.

Good Luck

Sure- one can still hit the repeater with a dummy load if they are looking right at it :-)

I cannot believe Comet sells so many $33 50 ohm carbon resistors in a plastic case. They work somewhat on 440, really poorly on 2 meters (to people I've talked, oops *tried* to talk to that have one).

If you want small, but don't want to make that big of a sacrifice- try a Maldol "Action Hunter" or "Active Hunter"- I forget the model no. They claim it is a dual-band 144/430 antenna, what it is is actually a 1/4wave helically wound (24 guage wire) antenna, 3" high, really flexible under a rubber condom, cut to resonate at 144.0

That means it works as a 3/4 wave radiator at 432.0 mhz, nice for the JA repeaters, sucks for our band plan. Since 1/4 wave antennas have a broader usable bandwidth than 3/4 wave, and I mostly TX on 449- I cut off one turn of wire from the top, which caused the SWR to bottom out at 446 and 148.xxx - a compromise I was willing to make.

Not nearly as good as any 8" or so duckie, but works, and on my Yaehoo FT 51 fits nicely in a coat/shirt pocket. Price -> $18.95, HRO, Berghardts, etc.

I was informed of the existance of this antenna by another ham who discarded his Miracle-dummy for one, and picked up a lot of additional usable range on low power- so there is no real comparision between the two products, unless you want perfect 1:1 SWR from 1Mhz-1000Mhz like the Comet-load offers, and want the 1" of less antenna height that Comet offers.

Source record: 217655

I recentley bought a HP 5245L and a 5247M counter at an auction.

Nice heavy-duty equipment (in my opinion) with red-glowing nixie
tubes. I paid $5 and $20 (equivalent money) respectively for these
units.

However with these units there came only 1 plug-in-unit, a 3-10 GHz
plug-in. I know there is several other plug-ins in the series 5251
to 5265 that could be used with these counters.

Are there anyone out there interested in selling plug-in units to me ?
I am looking for converter plug-ins for the 50 MHz to 3 GHz range.
But also other plug-ins in the 5251 to 5265 series are of interest.

Also, if there is anyone that have documentation for these counters
I am much interested in buying it to. Or maybe just a copy.

/Mattis

From: "Colin Schmutter"
Message-ID: <3otheg$srk@chopin.bcit.bc.ca>
Source record: 217657

I am using a Drake TR4C transceiver with an external receiver (Drake R4A).

I am new to Drake equipment.

The question is how can you ensure the external receiver is tuned to the
exact frequency as the transmit frequency of the TR4C

The Heathkit SB 401 transmitter for example has a "spot" position
so that you zero beat an external receiver to its transmit frequency.

Does the TR4C have a similar feature?

What methods do you TR4C owners use?

: going out? Do rigs usually keep going and going and going?

: It is a heathkit sb-102.

Dennis

After the tubes the next thing that usually give out are electrolytic capacitors. This can be subtle in some cases as the rubber seals go on them and they dry out significantly lowering the capacitance of the part. An electrolytic which has dried out will not necessarilly fail catastrophically (i.e. short out). So you may not always know that it has gone south on you.

Another thing that can change over time (sometimes dramatically) are the values of carbon composition resistors. In most cases vacucumn tube circuits are very tolerant of this type of drift but in some critical cases this can cause a cummalitive degradation in performance. Rather than measure every resistor in the radio. If you have the manual there should be a voltage chart for pin for pin, tube for tube. Measure the voltages and then investigate anything that is more than 10% off as to its cause.

If you are serious about restoring and collecting old radios, I would go out and buy a set of spare tubes NOW. As the years go by they will only become more scarce and expensive. It will likely enhance the value of the radio if you can advertise a set of New Spare tubes along with the radio when it comes time to sell it.

Good luck

>
>
Hi Dennis,
In gear that has been inoperative for years, the electrolytic caps usually
fail. Sometimes you can save them by applying power slowly using a variac.
Bring the voltage up in 5-10% steps, about 2 hours per step. This may reform
some of the caps, and save you the hassle of cleaning the mess up when the
B+ filter caps explode.

If the rig uses solid state rectifiers (I think it does, with tube finals),
remove the tubes before you do this. Also make sure that the mode switch
is in a position that will allow B+ to be present on the caps.

The other thing you need to be concerned with is the way the Heathkit was
assembled. They were ok radios if properly assembled, but that is a big if.
Some of the soldering I've seen in these is awful.

Have fun,
Joe - AA3GN

: handing out citations.

Lets look at this a little differently. This is not a NET COPS issue.

What you are seeing is the local citizens here in these groups trying to clean up the graffitti and posters on all the telephone poles in our neighborhood. The NET COPS can't touch all that graffitti, they are too busy being NET COPS.

I don't think any of us mind a commercial poster with some new information or a new product to sell. You can't ignore it!

Just what does a new cd-rom of amateur programs found here on the internet, have to do with Amateur Space, Policy, Digital, Antennas?

This graffitti should be seen in rec.radio.swap where there is no confusion about the commercial nature of the offer.

Would you like this graffitti problem in your neighborhood? The inner cities look like Hell, because no one cares. These commercial cd-rom folks will stop advertizing in our Amateur Radio Magazines and post here for Free. Do you want all the nuts and bolts magazine ads in our news groups? Hunderds of those little ads every week over and over. Then no more ham magazines...

Almost as bad as the SALE@ALLUS on amateur packet. Does anyone really read all that junk? Oh Sure! go eat a cookie.

Bob ;-)

>john.ackermann@daytonOH.attgis.com

John, see if you can borrow another 'scope. Have a look at the signal
at both deflection plates (with respect to chassis ground). If the signal
looks distorted (which I suspect it will be); then the fault is more likely in
the vertical amplifier which drives the plates. Work your way backwards
towards the 'scope input 'till you see an undistorted signal. The fault
probably lies somewhere near there. Fortunately, Tek use sockets for their
active devices, so removal for checking and substitution is easy. My bet is
you have a crook transistor, op-amp, or resistor gone high. Remember to check
your power supply rail voltages too.

>are some common things that could go wrong with it, other than tubes
>going out? Do rigs usually keep going and going and going?

Aside from tubes, the most frequent component to fail will be the
electrolytic capacitors. They tend to get leaky, or open, with age.
Aside from that, the other problem you'll face is worn/corroded
switches and noisy pots.

3879. YAESU FT-530 Out-Of-Band help needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-11 00:00:00 UTC
From: jdonimi@nv2.uswnvg.com
Message-ID: <3ou1b3$5uu@fred.uswnvg.com>
Source record: 217744

Hey all you Yaesu hackers please help me with something.

I downloaded the FT-530 mods from Oak.Oakland. They say to remove jumper 13 to open the receiver and open jumper 15 to limit transmissions to just the Ham bands.

BTW, I am the training manager at one of the top ten cellular companies and occasionally need to let my students hear what a control channel sounds like. Cellular companies are allowed to monitor the cellular frequencies, provided we don't violate a person's privacy and listening to a control channel is considered OK.

Anyway, I removed jumper 13 and, sure enough, the radio would receive the cellular band. Unfortunately, it would transmit on the commercial band (like 451 MHz) and I don't want it to do this in case I screw up programming an offset, or something. When I also removed jumper 15, the radio transmitted only in the ham bands but stopped receiving cellular freqs.

Is there a jumper that opens the receiver to any frequency but limits transmit to the ham bands?

3880. 8875 / 8874 tubes

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-11 00:00:00 UTC
From: gdavis@griffin.emba.uvm.edu
Message-ID: <1995May11.193355.20854@emba.uvm.edu>
Source record: 217745

Our club just bought an old Dentron MLA 2500. We paid about 500 $$.
I am now worried since the finals cost 450 to 475 each.

The model we have has two 8875s, but the ARRL tube manual makes no distinctions between the 75 and 74, except the 74 has 100 watts better plate dissipation. Does anyone know if there are other differences between these bottles other than plate dissipation and price?

Are they interchangable?

Yes, it is fraud and it is illegal in most states. Nevertheless, it happens
in many more retail outlets than you would want to know, or could
ever prove. As consumers continue to view ever-lower prices as
their only criteria to value, the practice will undoubtedly become
more prevalent.

Hi.

I am looking into purchasing an IC-730 from a local ham. The
radio is in real nice shape, and I know the owner takes good care
of his equiment. The only thing I, and the owner, don't know about
the radio is it's fair market value.

So, If anyone has purchased or sold an IC-730 lately, I am interested
in hearing the price.

Any feedback would be appreciated...

Hello Everyone,

I am looking for mobile VHF duplexor which will be used on a
portable emergency repeater for my local Amateur Radio Emergency
Service group.

The Cheaper the better but I need something that will work
fairly well. We will be transmitting with about 30 watts and using
the standard 600khz seperation.

If anyone knows anything about a duplexor for sale drop me a note.

Thanks...

>receiver sensitivity or desensing inside the case.
>
>3. Any experience with this? Remedies?

We found that the receiver was rather insensitive to start with. We
used a preamp from the previous repeater, and it's working again as well
as before we switched radios. I'd like to use a more modern preamp, though.
GE describes a preamp in their repair manual, but I think a GaSFET with
helical resonators would be an improvement. Anyone know of a good supplier?

Don't forget to adjust the squelch sensitivity control if your radio has one.

Anyone out there have the IRCI Kenwood TS 940 filter set with
the switching kit? I just got one from a former 940 owner, his
was torn out of the rig (not very elegantly) by Kenwood service
when they replaced the IF board and other major parts.

I need any IRCI instructions, and especially a schematic of the little
boards (there seem to be two). I have the matched set of 2.1 Khz
SSB filters, the matched set of 400 Hz filters, and an AM filter. There
are two small boards with several wires dangling, and even a diode
dangling from them. I need to figure out how to wire it in to my
940. Can anyone help me?

> McCoy if I have to..

You have to do level shifting because the rig communicates with TTL
signal levels. This is pretty easy with a MAX-232 or similar chip;
you can build your own interface for $10 to $20.

See February 1993 QST, page 37 for a detailed article describing
exactly how to do this. The circuit in that article also includes
optoisolators to make the interface more resistant to noise. The
isolators cost another $2 so they're well worth putting in.

: Is there a FAQ/info sheet on this maybe?

The Kenwood interface is just a TTL to RS-232 level translator, nothing special, except for the opto isolator and the 555 timer chip. The 555 is used to generate an AC signal that is rectified into a negative DC voltage that is used by the MC1488/MC1489 chips. If you're not worried about optical isolation, use a MAX232 chip. Greatly simplifies the problem. See back issues of QST or 73 Magazine. In the last couple of years there have been several circuits published that will work for you inexpensively.

In reference to the Comet CH 32 Miracle Baby:

My Alinco DJ 580 sports a Miracle Baby about 95% of its operating time. Though, things in my favor to consider are: I live only blocks from the repeater input antennas, both 2 meter and UHF. I seldom use simplex from the handheld. Most simplex work is done from base unit. For repeater work in and around town here its just perfect, but, I do keep a long flimsy dual band duck stashed in both cars in case I do get into a marginal area. I guess it's true that all's relative, but the CH-32 suits my needs.

3908. WTB:Low-Band VHF Mobiles

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-12 00:00:00 UTC
From: mccoyp@crpl.cedar-rapids.lib.ia.us
Message-ID: <3ovpgc$8t0@nexus.uiowa.edu>
Source record: 217676

I am curretly looking to purchase some pre-owned VHF-Low Band compact mobile units. (at least 2) that have crystals already installed (preferably business itinerant), are in good shape, and are reasonably priced. I would prefer Motorola or Regency units.

If you have some that you would like to part with, contact Paul at the following internet address:

McCoy@mmc.mtmercy.edu

I had an SB-102 for a number of years and also ran an electronics service company in Houston for awhile. Typical problems with older tube gear include:

leaky coupling capacitors
dried-out (loss of capacity) or leaky electrolytics
value changes in resistors (usually, but not always, downward)
intermittant ("dirty") potentiometers - they don't always "clean up"
intermittant ("dirty") switches - they *usually* do "clean up"

Three things I would look for on the SB-102:

This rig used a vernier tuning mechanism consisting of a friction drive on the rim of the plastic readout disc. Before I sold mine, I had already adjusted this several times. I remember thinking that someday it was going to wear out. Just make sure the tuning dial works smoothly and doesn't slip.

Except for the finals, tube sockets in this rig are soldered into PC boards. After awhile, the heat from the tubes darkens the boards around the sockets, causing the phenolic to become brittle. Be sure this process hasn't gone too far. If the areas of the boards around the sockets are black, or appear pitted, I would be concerned.

At least one of the controls in this rig is ganged by means of a thick rubber belt (round). After 25 years, it's likely either very brittle and/or cracked, or has stretched considerably. You can probably get an audio repair shop to order a generic replacement, but they will have to measure the original on a belt sizer. As a side note, someone recently posted an address here for Heathkit parts, although I don't know the company or how much they stock.

BTW, the SB-102 was an excellent performer in its time. Among other things, it offered genuine 6146B (continuous duty) finals and a solid-state VFO with external input for the varactor. The latter could be used for RTTY, and I also remember seeing articles on how to utilize it for adding receiver incremental tuning.

I saw an SB-102 advertised in one of these groups the other day for $200.00, including (I think) both DC and AC power supplies. I'm not even on the air right now, and I still almost wrote the guy. As spare (or first) rigs go, it doesn't get much cheaper.

73 & GL,

Jack WB3U

Since we're getting off on a tangent here, let's step back and take a look. Even though netiquette frowns on advertising, I enjoy hearing of new products that are closely related to amateur radio. Let's face it...for those of us with 'Net access, we're going to hear about it here well before it hits CQ, QST or the other mags.

Here's something that works for the Linux enthuiasts: a moderated group for announcements, which permits new product announcements, as well as other announcements of general interest to that group. The subject lines for advertising-related announcements begin with "COMMERCIAL:" While I ordinarily dissaprove of moderated groups on censorship grounds, this works quite well. Linux enthusiasts can browse this newsgroup, skipping all posts that are clearly marked as commercials if they wish. The function of the moderator is to keep posts not related to Linux off the newsgroup.

So...I'll pose the question...are we ready to propose adding rec.radio.amateur.announce to the hierarchy?

Thanks guys...

This NET-COP phenomena is the damnedest counter-productive thing I have ever seen. If I was truly spamming the groups with some trash, I would love every netcop that jumped on my posting. Hey, in advertising, any press is good press. Let's say I only intended to post just once but I made a mistake and it took a couple of postings to correct that. I would have only created three postings about as long as this one is. If that was all, I would be worried about getting enough exposure. BUT NOOO... I can count on at least a half dozen jerks with their heads up their butts jumping on my case and keeping my ad running for at least a couple of weeks. It doesn't even matter whether or not my "ad" is relevant to the newsgroups I post it in. I certainly welcome the quarterly, less than 1k, posting about the Ham CD's. Even if I hated them, would I want to have the newsgroup cluttered with 100k of netcop ranting? A good cop understands some human nature and knows when to let things slide or when to just let go...

We have a similar group now. rec.radio.amateur.info

How about rec.radio.marketplace for new product announcements

Many of the other large collections of newsgroups have established the
marketplace group for similar posts. It has been proved quite popular
with readers, as well as the marketers. One stop shopping.

I have misplaced (buried till February 1997 or later) or lost the
owners manual to my old Yaesu FT-2700RH mobile dualbander.

It's one of those radios where the VFOs and memory set their transmit
offset according to a manual slide switch, except that memory channels
1-8 let you store any transmit frequency. I'm looking for a reminder,
if anyone who has or had one of these machines recalls, of how to set
these transmit frequencies (or how to reset them to use the switch).

Answers by e-mail please. Anyone else dying to know the answer can
send me mail and I'll let you know what I hear.

I have a Kantronics Kam Plus that I would like to use for CW backup (I'm still a little weak on a few characters at higher speeds).

What I can't figure out is how to set it in CW mode. I bought it used with the software, but without the manual. I have Pacterm, Superfax, and KA Gold included with it. I have been told that there is a command mode that I need to set from Pacterm, the main problem I guess I'm having is that I can't get to the command mode from the help menu (F9 I think).

Can anyone tell me how to set the CW mode?

Thanks,
Ed Burress

I was able to purchase a Cushman CE-5 monitor at Dayton, without a book. The price was right, but there are a couple of problems with the unit, and I'm looking to find a manual, or get copies of the same, so I can repair and calibrate it.

My problem is no signal generator output. The fuse was blown, so someone probably transmitted into the mixer. Obviously, I need serious help! (Well, that too <G>).

If anyone can help me out, please E-mail me because I don't usually check into this group. Of course, I'm willing to pick up the customary costs for postage, copying, or even purchasing of a book.

Thanks, es 73, Nels....

3924. ACC DVR Digital Voice Recorder

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-12 00:00:00 UTC
From: jeffk@p51.corp.sgi.com
Message-ID: <3p0cra$8gh@murrow.corp.sgi.com>
Source record: 217692

I just bought (used) an Advanced Computer Controls Digital Voice Recorder (ACC DVR).
While looking through the manual, it says that while the board layout only accepts 64K or
256K
DRAM chips for a total of 1 MB, the hardware and software addressing capabilities can go
all
the way up to 8 MB.

I was wondering if anyone has modified their ACC DVR to accept maybe an 8 MB SIMM or
other such to max out the memory for more recording time? I'd be very interested in hearing
how to do this.

> inexpensively.

If you're not worried about optical isolation, and if your computer
uses 1488 drivers and 1489 receivers in the serial port, why not simply
use a single 1N4733 (5.1 volt) Zener diode to do the RS-232 to TTL
conversion? Put the 1N4733 across the transmitted data lead on the
serial port of the computer. That will convert the RS-232 transmitted
signal to TTL. You don't need to convert TTL to RS-232 for the 1489
receiver as it is already TTL compatible.

Anyway, that's how we cheapskates control our Kenwoods. 8^{)
As near as I can tell, the only thing special about Kenwood's interface
is that it costs $125!

3927. Re: Why should we not post commercial items

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-12 00:00:00 UTC
From: Philip Peake <philip>
Message-ID: <3p0js1$tk@hpbab.wv>
Source record: 217695

This doesn't really belong here - but since you asked ...

I hope you like history, because that is what you are going to get, a history lesson on the evolution of The Information Superhighway.

The original USENET mainly consisted of various sites connected via telephone lines and modems, usually 1200 baud (or 2400 if you were seriously rich).

This was a sort of private network (although anyone who wanted to join was more than welcome to do so). Since it was "private", and the participants paid all of the (significant !) communication costs, they could also excersize some control over what was passed. The only real limitations imposed were on commercial traffic (esp. advertising, after all would you appreciate some commercial enterprise using your 'phone bill to do their advertizing ?).

As USENET evolved, some sites, especially universities, who found it difficult to justify tens of thousands of dollars 'phone bills, began to use other means of communication; ARPAnet, and later NSFnet/Internet. These networks are/were publicly funded (mainly DoD funded). As such, they had restrictions imposed upon their use.

So you began to see people post relatively harmless, but nevertheless commerical
items, and howls of rage would come from those people who had decided that the American taxpayer was going to pay their communication bills. Forget the fact that using these networks to carry private e-mail and USENET newsgroups was probaly a direct infringement of the conditions of use of these networks, the mere thought of anything blatantly commercial being carried, and maybe even noticed by someone, caused the people using these networks sleepless nights.

In much of the rest of the world, and, yes, there is life outside the shores of America, networks were mainly run as semi-private ventures (e.g. EUnet), and no-one would get into any sort of legal trouble for commercial use, but there was (and is) a general feeling that, running the networks was expensive enough, without commercial users filling it with junk mail, degrading performance and raising costs.

In some countries, the private networks would have had problems with telecoms authorities, if they thought that they might be losing revenue by someone using a private network rather than paying through the nose for the government provided "service".

These days, much of "the InterNet" (or SUPERHIGWAY or whatever buzz phrase you want to use) is actually carried on commercial networks, and there really isn't any legal, moral or ethical restriction on commercial traffic.

However, as you peruse these newsgroups, you can't help but notice that it is already difficult enough to extract the usefull and interesting data from the random babbling of the the majority. There really *are* people who look to many of the newsgroups (like this one) for real, usefull information. If the content to babble ratio were further reduced by the introduction of significant amounts of commercial traffic these groups would lose their reason for existence.

If you want to do commercial type things, can I suggest that you take a look at the World Wide Web ? it is much better adapted to that sort of use.

Philip

Electrically - yes. Thermally - no. The '75 have horizontal fins for
horizontal mounting of tubes. The '74 have vertical fins for vertical
mounting of tube. BTW, the '73 is conduction cooled.

>replace tubes to eq,

There were a host of modifications published for these rigs back in the 1970s. Some of them used "tubesters" to replace the vacuum tubes with solid state equivalent circuits. The result was often far less than satisfactory. However, there are a couple of very worthwhile modifications to the audio section. I no longer have them on file, but the general idea is to use a modern integrated circuit audio amplifier and feed it with *regulated* power. The latter modification is well worthwhile in itself as it removes a good deal of hum and noise from the receiver. The stock audio stages are *the* weak point of this equipment. Getting a good quiet audio amplifier with a good flat passband will make using these receivers much more pleasant.

Just consider you got a good price on the tubes, and the rest of the parts were thrown in for free. If you don't abuse them, the tubes will last for years. I also have a MLA2500, and if the tubes ever go, I'll just buy another amplifier. It's not cost effective to re-tube it.

The TR-3 with mobile supply, if in good shape,
(no drilling holes in the case, case not repainted,
face not badly scratched, all original knobs, no modifications)
is worth about $225-250. Goes down from there, and many
have been sold complete for under $200.

The TR-4/C/CW is much more popular and goes for $300-350
depending on condition.

Best of luck ES 73 AB5S/7 Dave in Lost Wages, Nevada

>What is the digital bandwidth equivalent of a commercial radio broadcast?
>Does compression cause problems with quality? how recognizable?
>
>... where else should I check?

Hmm. This isn't a simple question. We still use switched-56 links for our broadcast quality audio distributions. Most of the schemes that achieve high compression factors are lossy, so fidelity isn't preserved across the link. How much degradation you can tolerate is a function of the program material being transmitted.

If you want full 20 Hz to 20,000 Hz bandpass, stereo, and full 16 bit resolution, then Nyquist limit sampling puts your raw bit rate at 1.28 Mbit/sec without accounting for multiplexing overhead. You need an almost 23x compression to fit that in a 56kb channel.

If you can tolerate reduced dynamic range, you can drop to 12 bit sampling, but dropping down to 8 bit sampling sounds really bad with most music. Codecs can do silence removal and spectral folding to further reduce the required bit rates, but you're starting to stray from realtime at that point. LPC and delta modulation can further reduce average bitrates, but destroy dynamic response and add increasing amounts of quantization error. LZW compression can buy you more throughput, up to 4x or sometimes 8x. But to really crunch the bits, you need to go to one of the lossy fractal compression algorithms. The sound you recover won't be the same as what you sent, but it can sound similar. You can still get understandable speech with bitrates as low as 4800 bps, but you'll probably have trouble recognizing the speaker.

Hey look, I never meant to create a flame war here. I was just fed up by the downfall of the local 2 meter repeater. The last time I had my two meter rig on I heard "breaker 144", that was it for me.
I had no interest in "the early morning weather net" also. I am not saying the net sucked, just that it wasnt for me.
I was once a novice myself, for about a month. I had to learn code. then had to get better at it and drive 100 miles to NYC to take a test at the 'local' fcc office. thats how I became a ham. yes, it was displeasing to me to see a codeless ticket available and but thats MY problem. I never meant to offend anyone.
all I want to do is sell a rig. thats all. I dont care if I get on 440 or any other band at this point.

comments welcome, flames will be trashed.

I've bought from W&W for a variety of radios. So far quite pleased. Their prices seem to be less for some applications, the same for others. The FT530 uses the FNB25/26/27 series. W&W sells these from $35 to $49, with various models from 7.3v/600mah to 12v/800mah. They have a 7.2v/1500mah as well. I'm not at all brand-loyal 'tho, the moment somebody offers a better deal....

3946. Recommendations For Two-way Radios

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-13 00:00:00 UTC
From: "A.J. Whitney" <aw20+@andrew.cmu.edu>
Message-ID: <sjh5sy200iVE8B5oEx@andrew.cmu.edu>
Source record: 217629

Please excuse me if this is not the appropriate place to post this message.

I am looking for a pair of good quality two-way radios with headsets with at least a couple mile range. I know Motorola generally makes good radio equipment so that's kinda what I'm looking at currently. A single channel is probably sufficient (although the more the merrier). I will need voice-activated (with switchable push-to-talk capability for really noisy conditions) headsets for both that work well in windy conditions. I know a couple of ski resorts that use setups similar to this for ski patrol. Does anyone have a suggestion as to a particular model (or brand other than Motorola)? Is there a mail-order supplier that handles this sort of equipment (there seems to be for most other electronics)? Phone numbers would be very helpful here. Also, what about chest or back-pack style velcro-closure accesories for holding the radios (standard belt-mounted holsters aren't going to work for this).

Oh an in case you are wondering...we will be using these for communication during extended biking trips (and probably other stuff too). Maybe this will help with suggestions (ie. headsets that easily fit under bike helmets would be a plus). We would prefer to spend a little more and end up with long-lasting quality equipment (if that helps with suggestions).

Thanks.

3947. re: old rig

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-13 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <c7a_9505130316@mba.mba.org>
Source record: 217630

kc7fqd@primenet.com (Dennis Rice) is thinking of buying an old SB-102 (old? I can remember when it was new) and was wondering what common things might be wrong with it, other than the tubes going bad.

gary@ke4zv.atl.ga.us (Gary Coffman) responded, mentioning bad electrolytics and switches with dirty contacts and noisy pots.

That made me want to add one imortant point. An old rig suffers because it uses tubes, and tubes are not as common as they once were. But those old rigs have a benefit; they are much simpler than the rigs of today. You might have to do some work to get an old rig going, or to get it up to snuff, but it is a whole lot easier than trying to fix up a rig of today. Things were not as compact, the parts were all standard, and there weren't the bells and whistles of today's rigs to add complications to troubleshooting.

One thing that keeps people from trying to fix their own equipment must surely be the fear of doing damage, and the fear that it is hard to work on. An older rig, where you probably won't pay too much for and which is not microminiaturized, provides a chance to give repair a chance.

Unscrew the the outside 4 screws on the top black section of the case. Then all you need is to unscrew the very bottom 2 screws in the metal part under the battery. You do not need to remove the upper 2 screws under the battery to get inside the radio. Have you figured out how to modify to extended transmit yet? Saw something somewhere about d15, but haven't seen anything solid. Do you know for sure? If so can you help locate that diode?....Thanks.

3957. Automobile Noise

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-14 00:00:00 UTC
From: skip@pacifier.com
Message-ID: <3p63vj$gf7@news.pacifier.com>
Source record: 217555

Years ago, I read something about various things that could be done to quiet electronic interference from automotive components. The ignition system, alternator, heater motor, windshield wipers all emit electronic interference. Modern cars tend to have better shielding and more care has been taken in design to keep components from interfering with radios and other electronic devices in the car.

Does anyone know of a handbook or article which addresses remedies for components in older cars? I seem to remember something about condensers or capacitors soldered across terminal points on the alternator and the motors, but can't lay my hands on the document. It came with specific values and detailed advice in installation. I'd sure like to know where I could get that information. Help!

Jeff -

Of those 7,000 newsgroups, how many are totally bogus and mostly or
totally unused, such as:

alt.brian.saunders.pot.kettle.black
the whole alt.bonehead heirarchy
alt.bubba-love.el-caminoville
alt.bruce.it.was.just.an.accident
alt.butt-keg.marmalade
alt.cancel.bots
alt.check.her.miss-jesus
alt.choad

etc., etc. This list could go on and on. I'm really curious as to how
these newsgroups got started. They certainly don't serve a purpose
because nobody ever uses most of them and their names are totally wierd.

The GE Mastr II receiver is a little deaf, 12 dB SINAD on the order of
0.5-0.7 microvolts is common. The optional GE bipolar preamp can be
effective, but there is a better solution. Hamtronics makes a helically
filtered GASFET preamp that works great in front of the GE receiver.
12 dB SINAD drops down into the 0.2-0.3 range with it in line. There
are hotter preamps on the market, but at a high RF site the extra
filtering offered by this preamp is very welcome. It's better to have
a clean receiver than rabbit ears. Recomended.

I disagree that the QST review was favorable. Because it would not be prudent to really slam a big-time QST advertiser like ICOM, QST puts the best possible spin on all their reviews. However, if you read between the lines, you can tell that they really did not like this radio. I don't have the article in front of me, but I recall them saying something to the effect of "you could get a lot more radio for what this one cost." If I were looking for a radio in this price range, I would buy a good used Kenwood TS-850S/AT, but if your friend makes you a good price, the 736 might be worth consideration. Just one man's HO.

: How about rec.radio.marketplace for new product announcements

: Many of the other large collections of newsgroups have established the
: marketplace group for similar posts. It has been proved quite popular
: with readers, as well as the marketers. One stop shopping.

Either approach would be fine with me. Since there is already a .info
newsgroup, wouldn't it make more sense to simply direct advertisers to the
appropriate newsgroup, instead of wasting the bandwidth (and everyone's
time, surely a more valuable commodity) flaming these vendors? Of course,
there's still the problem of spamming the entire rec.radio.amateur.*
hierarchy.

You can not get round this problem (me-thinks!)
Memory 9 is a read-only memory or write- from- air- only memory.

Memory 9 keeps a tab on the last DTMF tones *heard* over the
air! Get someone with another DMTF H/H to xmit the number to you. ;)

>replace tubes to eq,

There were a host of modifications published for these rigs back
in the 1970s. Some of them used "tubesters" to replace the vacuum
tubes with solid state equivalent circuits. The result was often
far less than satisfactory. However, there are a couple of very
worthwhile modifications to the audio section. I no longer have
them on file, but the general idea is to use a modern integrated
circuit audio amplifier and feed it with *regulated* power. The
latter modification is well worthwhile in itself as it removes
a good deal of hum and noise from the receiver. The stock audio
stages are *the* weak point of this equipment. Getting a good
quiet audio amplifier with a good flat passband will make using
these receivers much more pleasant.

> inexpensively.

If you're not worried about optical isolation, and if your computer
uses 1488 drivers and 1489 receivers in the serial port, why not simply
use a single 1N4733 (5.1 volt) Zener diode to do the RS-232 to TTL
conversion? Put the 1N4733 across the transmitted data lead on the
serial port of the computer. That will convert the RS-232 transmitted
signal to TTL. You don't need to convert TTL to RS-232 for the 1489
receiver as it is already TTL compatible.

Anyway, that's how we cheapskates control our Kenwoods. 8^{)
As near as I can tell, the only thing special about Kenwood's interface
is that it costs $125!

73,

> It is a heathkit sb-102.
>
>
Hi Dennis,
In gear that has been inoperative for years, the electrolytic caps usually
fail. Sometimes you can save them by applying power slowly using a variac.
Bring the voltage up in 5-10% steps, about 2 hours per step. This may reform
some of the caps, and save you the hassle of cleaning the mess up when the
B+ filter caps explode.

If the rig uses solid state rectifiers (I think it does, with tube finals),
remove the tubes before you do this. Also make sure that the mode switch
is in a position that will allow B+ to be present on the caps.

The other thing you need to be concerned with is the way the Heathkit was
assembled. They were ok radios if properly assembled, but that is a big if.
Some of the soldering I've seen in these is awful.

Have fun,
Joe - AA3GN

Hello...

I am after the circuit diagram (schematic) for an Alinco DR-590 Dual
band mobile rig.

I just bought it secondhand...and it appears to have a VCO type problem
on the UHF side. Also required is the CTCSS Encoder/Decoder board (EJ-7U).

Are Alinco still located at 438 Amapola Avenue, Unit 130, Torrance, CA 90501
and the phone number is (213) 618-8616.

Thankyou for your assistance.

PK900 Ground Loop/AC HUM
Got my PK900 TNC kooked up to my station supply. All of the
sudden AC hum on my VHF set TX signal.

- When I turned the rig off, hum went away.
- When I put the 900 back on the power cube, hum went away
- When I grounded the chasis, hum DI NOT go away

Any ideas???

Thanks in advance

From: jeffk@p51.corp.sgi.com (Jeffrey Komori)
Subject: ACC DVR Digital Voice Recorder

I just bought (used) an Advanced Computer Controls Digital Voice Recorder (ACC DVR).
While looking through the manual, it says that while the board layout only accepts 64K or
256K
DRAM chips for a total of 1 MB, the hardware and software addressing capabilities can go
all
the way up to 8 MB.

I was wondering if anyone has modified their ACC DVR to accept maybe an 8 MB SIMM or
other such to max out the memory for more recording time? I'd be very interested in hearing
how to do this.

Ron Edwards (EDWARDS-MD-SM@REDSTONE.ARMY.MIL) wrote:
: Of all the logging programs available, there's one that doesn't get much
: press, LOG-EQF written by Tom, N3EQF. I have used it for 2 years and
: find it to be easy to use and it is not expensive. It is full featured
: and upgrades, also inexpensive, come about once a year. Support for
: questions or problems is excellent

: 73
: Ron WB4RUO

I agree LOG-EQF is quite good. But then there is Ham Log 3.1 by VK2VN which
is professional and reviewed as...

On version two, Len Shaw editor of Amateur Radio Action wrote:
"The author has gone considerably further (on features) than
in any log program... ...you are unlikely to find a better
log-keeping program anywhere. Having seen and used a wide variety
of shareware and commercial programs, I believe this one to be
excellent value for money... I would say the same if it was
double the cost." On v.2.4: "The Best Gets Better".

In France's Megahertz: "Installation: Easy! ...neat professional
which remains simple to use".

On version 2.5 The Canadian Amateur magazine wrote:
"This is the first program I have used in years that I really
cannot find anything to improve on."

Now, there is version 3.1 of Ham Log. (Functioning version
available on the Internet - HAMLOG3.ZIP at oak.oakland.edu) Give
it a go, you will be pleasantly surprised.

Aside from tubes, the most frequent component to fail will be the
electrolytic capacitors. They tend to get leaky, or open, with age.
Aside from that, the other problem you'll face is worn/corroded
switches and noisy pots.

From: Michael.Black@juxta.mba.org (Michael Black)
Subject: old rig

kc7fqd@primenet.com (Dennis Rice) is thinking of buying an old SB-102 (old? I can remember when it was new) and was wondering what common things might be wrong with it, other than the tubes going bad.

gary@ke4zv.atl.ga.us (Gary Coffman) responded, mentioning bad electrolytics and switches with dirty contacts and noisy pots.

That made me want to add one imortant point. An old rig suffers because it uses tubes, and tubes are not as common as they once were. But those old rigs have a benefit; they are much simpler than the rigs of today. You might have to do some work to get an old rig going, or to get it up to snuff, but it is a whole lot easier than trying to fix up a rig of today. Things were not as compact, the parts were all standard, and there weren't the bells and whistles of today's rigs to add complications to trou
bleshooting.

One thing that keeps people from trying to fix their own equipment must surely be the fear of doing damage, and the fear that it is hard to work on. An older rig, where you probably won't pay too much for and which is not microminiaturized, provides a chance to give repair

a chance.

Subject: Para Dynamics PDC9 SWR/PWR meter?

I purchased a Para Dynamics PDC9 SWR/PWR meter at the
Dayton Hamvention. It is the VHF/UHF model which has
two power ranges: 15W and 60W. Well, it seems to have
a problem measuring reflected power. I'm not getting
any reflected power at all no matter what antenna
I hook up to. My guess is that one of the detector
diodes is blown or defective. I've opened the unit up,
and everything looks nominal to the naked eye.

Problem is, there is no address for Para Dynamics anywhere
on the package or on the sheet of instructions. The
only clue is a "Made in Korea" on the back of the package
next to the specs. Does anyone know how I can contact
this manufacturer?

Please respond by E-mail, as my net access is by long-distance
land line, and I don't get on here too often.

From: Philip Peake <philip@ucsd.edu>
Subject: Why should we not post commercial items

This doesn't really belong here - but since you asked ...

I hope you like history, because that is what you are going to get, a history
lesson on the evolution of The Information Superhighway.

The original USENET mainly consisted of various sites connected via telephone
lines and modems, usually 1200 baud (or 2400 if you were seriously rich).

This was a sort of private network (although anyone who wanted to join was
more than welcome to do so). Since it was "private", and the participants
paid all of the (significant !) communication costs, they could also excersize
some control over what was passed. The only real limitations imposed were
on commercial traffic (esp. advertising, after all would you appreciate some
commercial enterprise using your 'phone bill to do their advertizing ?).

As USENET evolved, some sites, especially universities, who found it difficult
to justify tens of thousands of dollars 'phone bills, began to use other means
of communication; ARPAnet, and later NSFnet/Internet. These networks are/were
publicly funded (mainly DoD funded). As such, they had restrictions imposed
upon their use.

So you began to see people post relatively harmless, but nevertheless
commerical
items, and howls of rage would come from those people who had decided that the
American taxpayer was going to pay their communication bills. Forget the fact
that using these networks to carry private e-mail and USENET newsgroups was
probaly a direct infringement of the conditions of use of these networks, the
mere thought of anything blatantly commercial being carried, and maybe even
noticed by someone, caused the people using these networks sleepless nights.

In much of the rest of the world, and, yes, there is life outside the shores of
America, networks were mainly run as semi-private ventures (e.g. EUnet), and

no-one would get into any sort of legal trouble for commercial use, but there was (and is) a general feeling that, running the networks was expensive enough, without commercial users filling it with junk mail, degrading performance and raising costs.

In some countries, the private networks would have had problems with telecoms authorities, if they thought that they might be losing revenue by someone using a private network rather than paying through the nose for the government provided "service".

These days, much of "the InterNet" (or SUPERHIGWAY or whatever buzz phrase you want to use) is actually carried on commercial networks, and there really isn't any legal, moral or ethical restriction on commercial traffic.

However, as you peruse these newsgroups, you can't help but notice that it is already difficult enough to extract the usefull and interesting data from the random babbling of the the majority. There really *are* people who look to many of the newsgroups (like this one) for real, usefull information. If the content to babble ratio were further reduced by the introduction of significant amounts of commercial traffic these groups would lose their reason for existence.

If you want to do commercial type things, can I suggest that you take a look at the World Wide Web ? it is much better adapted to that sort of use.

Philip

I've bought from W&W for a variety of radios. So far quite pleased. Their
prices seem to be less for some applications, the same for others. The FT530
uses the FNB25/26/27 series. W&W sells these from $35 to $49, with various
models from 7.3v/600mah to 12v/800mah. They have a 7.2v/1500mah as well. I'm
not at all brand-loyal 'tho, the moment somebody offers a better deal....

Subject: Drake TR3

The TR-3 with mobile supply, if in good shape,
(no drilling holes in the case, case not repainted,
face not badly scratched, all original knobs, no modifications)
is worth about $225-250. Goes down from there, and many
have been sold complete for under $200.

The TR-4/C/CW is much more popular and goes for $300-350
depending on condition.

Subject: IC-730 Market Value?

Hi.

I am looking into purchasing an IC-730 from a local ham. The
radio is in real nice shape, and I know the owner takes good care
of his equiment. The only thing I, and the owner, don't know about
the radio is it's fair market value.

So, If anyone has purchased or sold an IC-730 lately, I am interested
in hearing the price.

Any feedback would be appreciated...

Subject: Recommendations For Two-way Radios

Please excuse me if this is not the appropriate place to post this message.

I am looking for a pair of good quality two-way radios with headsets
with at least a couple mile range. I know Motorola generally makes good
radio equipment so that's kinda what I'm looking at currently. A single
channel is probably sufficient (although the more the merrier). I will
need voice-activated (with switchable push-to-talk capability for really
noisy conditions) headsets for both that work well in windy conditions.
I know a couple of ski resorts that use setups similar to this for ski
patrol. Does anyone have a suggestion as to a particular model (or
brand other than Motorola)? Is there a mail-order supplier that handles
this sort of equipment (there seems to be for most other electronics)?
Phone numbers would be very helpful here. Also, what about chest or
back-pack style velcro-closure accesories for holding the radios
(standard belt-mounted holsters aren't going to work for this).

Oh an in case you are wondering...we will be using these for
communication during extended biking trips (and probably other stuff
too). Maybe this will help with suggestions (ie. headsets that easily
fit under bike helmets would be a plus). We would prefer to spend a
little more and end up with long-lasting quality equipment (if that
helps with suggestions).

Thanks.

Michael Black (Michael.Black@juxta.mba.org) wrote:
: Visor@globalcom.net brings up the point that he remembers that the S38 did not have a BFO, but provided a beat by putting the IF into oscillation.
:
: I think he's right. I recall seeing things about this; I seem to recall seeing at least one article on upgrading the S38, and it included adding a separate BFO.
:
: But if I am remembering this right, then I also remember that the S38A did add a separate BFO, for what it's worth.
:
The original S38, the one I have, has a separate BFO stage. It is a SIX tube radio as opposed to the american five. the output stage is a 35L6 instead of a 50L6. There is a BFO control on the front panel. Later versions did not have one. The date on the manual for my radio is "August, 1946."

The complete tube complement for the S38 (no suffix) is:

12SA7 Mixer-Oscillator
12SK7 IF amplifier
12SQ7 Detector-1st audio-AVC
12SQ7 BFO-Noise limiter (yes, there is a noise limiter switch on the FP)
35L6 Audio output
35Z5 Rectifier

Mike Cowart e-mail: cowart@convex.com Convex Computer Corp.
My opinions are mine, not my employer's. Richardson, Texas

Our club here at work bought such a rig to use for an emergency communications setup (i.e., there's an earthquake, the phones are down, and we need to call for a fire truck; (we're out in the country))

Our primary consideration was ease of use, as we'll probably not use this radio very frequently, so we needed something we could figure out without a manual, at least for the basic stuff.

We wound up getting an ICOM IC-2340H. It also has the attraction of the ICOM service center in nearby Bellevue, WA.

The radios we looked at were:

Icom IC2340H, Yaesu FT-5200, Standard C5718, and Kenwood TM-733A.

We've only had the ICOM for a couple of weeks, but so far I really like it. It's relatively easy to use, the duplicated controls for VHF and UHF make it easy to tune and control. We are also across the street from a fairly high powered UHF pager transmitter, somewhat notorious for causing intermod problems. We haven't yet heard any intermod of significance on the ICOM from it.

A personal note on the Kenwood: playing with it in the store, I got
it locked up solid, just trying to tune to a memory channel. So locked
up that the salesman had to cycle power with reset depressed to unlock it!
I did not find it's user interface at all intuitive.

The standard was also fairly unfriendly I thought; *All* the controls are
on the microphone, and I just looked at it in confusion for a minute and
put the mike down.

I did a score sheet on the radios we looked at, and here it is:

Wt Icom Std Yaesu Kenwd
3 Ease of changing bands 4 2 3 3

3 Ease of recalling and setting memories 4 1 2 1

3 Ease of direct entry of frequency (VFO) 4 2 3 3

3 PL tone stored with memory channel 4 4 4 4

2 Automatic determination of repeater 4 ? 4 ?
splits with frequency

3 Ease of going simplex 3 2 3 2

1 Back-lit keys and functions 3 2 1 4

1 Head set and mike

2 Ease of power output change. 3 3 4 4

3 General ease of control use. 3 1 3 2

1 Dual in-band recieve (listen to 2 2m 0 4 0 4
channels or 2 440M channels at once.)

1 Auto-mute of un-selected band 0 4 0 0

2 Built in diplexer 4 4 4 0

Score: 87 64 75 65

Hope this is of some use..

I just went for the Standard 5718. I really like it; especially the way
that you can control the entire rig from the display mic. When parking on
the street, I just put the mic under the seat with the radio and no one
know's it's there (besides the antenna on the car). The expanded receive
is the widest on the market and the thing is packed with features.

Josh, N2JLL/9

[3]

Hi David. I have two Yaesus mobile dual banders, an older FT-4700 and a newer FT-5200, both in current service. I choose them both for the remote mount capability of the front panel. It is the only way to get both bands neatly installed in a modern auto with a center console. It allows for a real slick installation. Both rdios have been flawless. The 4700 is mores than 4 years old. The 5200 is about 18 mos old.

I have heard that the Alinco radios are very subject to intermod interference. I can tell you that the Yaesus that I own are not immune either when in high RF areas such as NYC. Some of the dual banders need an external duplexer if you plan to use a single dual band antenna. That costs about $50. The 4700 needs one, the 5200 has it built in. There are pros and cons to both scenarios. If you wish to run an amp on only one band, the external duplexer allows you to do that in only one bands feedline. If inetersted in that, be sure to get a duplexer and antenna of suitable power. There are some dual band amps, but mostly lower power than I usually use. I prefer the Diamond line of mobile antennas.

Good luck,

Tom
K2CZ

---

[4]

I have Kenwood TM742. I bought it because I already own a Kenwood TH78A. Also, a bunch of my friends also have Kenwood; that makes it easier to learn from each other.

In general, I like the radio. There is no particular point I dislike about it. I live in L.A. Intermod is generally not a serial problem for me, may be I am not in the most series area. When I do experience intermod it is generally in the 440 MHz band.

One nice feature about TM742 is that you can add a third band, such as 220 MHz, 50 MHz, or 1.2 GHz.

David,

I will tell you about which radio to purchase but please send me all you comments because I am also interested on what others have said.

Personally I would purchase the Yaseu FT 530. The Kenwood TH series has great audio and features however it is a bit finnicky and not very robust and Kenwood is very expensive to repair. The Icom W21A has lousy audio but a very capable rig. Good receive capabilities form about 100MHz to 900MHz.

The Alinco is also not a bad piece of gear however the current models do not seem to be put together as well as the others.

Regards,

Len Spain

Subject: Re: Tell me about your mobile dual purchase...I'm looking

David,

I'm using a Kenwood TM-731A. I've only had one problem with it that I hope is cured. If I needed another mobile rig I would consider another Kenwood. If you need a Duplexer I recommend a Larsen. If you purchase a duplexer, especially a Genisys, I would check it against it's performance specs.

If you're thinking of using DSQ encoding/decoding check to see if any repeater you might be using will pass the DTMF tones. The ones around Kansas City often do not. The repeaters I worked on decoded the DTMF,filtered it out, regenerated it cleanly to the phone lines, then kept it from being re-transmitted. Not only did this give more reliable switching, it keeps those monitoring from decoding DTMF phone numbers.

Good Hunting,
de N0USP

>receiver sensitivity or desensing inside the case.
>
>3. Any experience with this? Remedies?

We found that the receiver was rather insensitive to start with. We
used a preamp from the previous repeater, and it's working again as well
as before we switched radios. I'd like to use a more modern preamp, though.
GE describes a preamp in their repair manual, but I think a GaSFET with
helical resonators would be an improvement. Anyone know of a good supplier?

Don't forget to adjust the squelch sensitivity control if your radio has one.

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October 1994 to add the discussion of non-Usenet mailing lists and streamline most of the history discussion, and to change the moderator information for rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I use the R-5, which is similar to the R-7 with the exceptions that it doesn't cover 30, 40M, and it has broader bandwidth on 20M. Performance has been all that one can ask for from a non-directional antenna.

I've got the Periphex 12v - 800 maH battery for the FT530. Works great.

The only thing I've noticed about Periphex is that the fit of the last two batteries I've bought has been tighter than I like. A careful inspection of the interface shows that it doesn't quite match the Yaesu battery. I've filed a bit of plastic to fix it. It's not a big problem.

The DSPs work somehow but not great. Another alternative is a noise
canceller, where the local noise is deducted from the main antenna
before it enters the rig. The canceller is not suitable for moving
setups.

Source record: 217571

Bill, Im afraid you wont be buying any mobile duplexers to work at 600Khz on VHF....the closest spacing most VHF mobile duplexers work is 3Mhz....A 600Khz spaced system is a small percentage of the operating freq and the size of the cans have to be large for such a narrow spacing.

DONT buy any VHF MOBILE duplexer....it WONT work...

the ONLY small duplexer I have even work at 600Khz was the PC Board job in QST years ago...yet it had extreme high loss (3db or so) compared to most models...

For an emergency rptr, go with two crossband radios....and then you can go split site...no cans needed!

I too have purchased the Action Hunter and have to say that it is the
best purchase rubber duck wise I have ever made!!! I have actually tested
my AH with the stock TH-78a rubber duck and the FT-530 EARLY rubber duck
and found the AH to actually blow the doors off the other two! I believe
that the AH even beat the NEWER stock FT-530 rubber ducks.... But I
haven't tested it yet... and would find it HARD to believe! But if you
want to look Cellular with your HT the AH does well in looks, usability,
and durability!!! They don't really push this fact too much either, but
the AH is actually a TRI band duck... that works on 900 megz
somewhere...don't want to do the math right now, but it works rather well
on RX the "900Mhz" ham band ;)!!!

compare:

1" length = saving over $13 = over %100 better range difference
(tested this too...) = flexability!!!!

Hope that helps!!!

: > I have been considering the 1.75 inch long micro-stubby dualband antenna
: > from comet model CH-32...
: >
: > any body have any experience with it,
: > any comparisons
: > likes or dislike

: Sure- one can still hit the repeater with a dummy load if they are looking
: right at it :-)

: I cannot believe Comet sells so many $33 50 ohm carbon resistors in a plastic
: case. They work somewhat on 440, really poorly on 2 meters (to people I've
: talked, oops *tried* to talk to that have one).

: If you want small, but don't want to make that big of a sacrifice- try a Maldol
: "Action Hunter" or "Active Hunter"- I forget the model no. They claim it is a
: dual-band 144/430 antenna, what it is is actually a 1/4wave helically wound (24
: guage wire) antenna, 3" high, really flexible under a rubber condom, cut to
: resonate at 144.0

: That means it works as a 3/4 wave radiator at 432.0 mhz, nice for the JA
: repeaters, sucks for our band plan. Since 1/4 wave antennas have a broader
: usable bandwidth than 3/4 wave, and I mostly TX on 449- I cut off one turn of

: wire from the top, which caused the SWR to bottom out at 446 and 148.xxx - a
: compromise I was willing to make.

: Not nearly as good as any 8" or so duckie, but works, and on my Yaehoo FT 51
: fits nicely in a coat/shirt pocket. Price -> $18.95, HRO, Berghardts, etc.

: I was informed of the existance of this antenna by another ham who discarded
: his Miracle-dummy for one, and picked up a lot of additional usable range on
: low power- so there is no real comparision between the two products, unless you
: want perfect 1:1 SWR from 1Mhz-1000Mhz like the Comet-load offers, and want the
: 1" of less antenna height that Comet offers.

I believe that when I looked at the radio, I noticed that it had
a Kenwood-like appearance, including the connector for the power. You
may want to contact a ham radio dealer (such as HRO or AES), and order
a Kenwood power cord from them. (The radio looks similar to the
Kenwood TM-241 to me, in case they want a model number for the unit.)

>I have no idea of brands, models or prices. Help!!

2m meter HT (handy talky) are okay, as long as your on a mountain or
flat ground. If you are in a valley, it won't work at all. 2m is
strictly line of site. HF radio bounces signals off the atmosphere, so
hill or valley location would make no difference. There are some HF
drawbacks:
1) 5 watts is about as much as you would care to carry, so
transmit would have to be CW (morse code) to be effective, voice won't
carry at this power level.
2) The skip zone around you will be roughly 500 miles, so no one within
500 miles of you could hear you.
3) HF liscense requires you to pass a morse code test.

(2m liscense only requires written test)

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

I just got my HF tech+ lisense and having trouble transmitting in my apartment. I am on second floor. Radio is TS-820 with 300w antenna tuner running a 23 foot indoor dipole.

Right now I have no ground since am leary of running a cord out window and pounding rod into premises.

I find I can not transmit more than 5 watts CW without interferring with my TV (using cable antenna). TV is eight feet from dipole overhead.

I've heard that even if I ran a 20 foot ground line to a rod in ground, its legth would turn it into a antenna. How can I eliminate TVI on second floor (cheaply)?

How many watts have you runn successfully without disturbing neighbors?

I bought my 727 some time ago, along with a friend of mine. I have had it fail
once a couple of years back (totally dead unit) -- repaired at Yaesu. It has
worked fine ever since.

I have never had the problem you are describing and neither has my friend.
His has worked fine forever. We still use them quite a bit and other than
mine dying(minor repair), they work like a charm.

Owned one since 1991 (paid close to $600 for it then). It's been a solid,
reliable, (for it's time) well featured dual band 2M/440 HT. It has 3 power
settings 5w, 1.5w and .5w. It holds 30 presets, has CTSS & DTMF built in.
Supports paging with a variety of options. I find the manual very difficult
to understand with regard to the more complex programing but I know others
who have no difficulty eith it. The value of a quick charger and the batteries
probably exceed $250 (depending on cycles remaining and condition). Assuming
good condition the seller is pretty much giving you either the radio or the
batteries and quick charger (a slow charger and one "little" battery was
included with the radio).

>with my TV (using cable antenna). TV is eight feet from dipole overhead.

Several things:

1. The dipole is probably overloading the TV. Eight feet is simply too close to avoid significant RF pickup. Try a high-pass filter at the TV input and move the dipole further away.

2. If your dipole isn't resonant, and if you have RF on the chassis of the rig, you may also be putting RF into the house wiring through your third-wire ground. You're right about the ground - it's difficult to achieve an effective RF ground on a second story. There are several solutions to this, but my favorite is to build a system that prevents the feedline (and chassis) from wanting to radiate in the first place. Having done this, any significant RF pickup by the house wiring can then be attributed primarily to mutual coupling.

3. Low-level harmonics from your rig may be interfering with the TV, simply because of the proximity of your dipole. A low pass filter at the transmitter might help, but bear in mind that if you have RF on the chassis, unfiltered RF will still be radiated.

I've had many indoor antennas in the past. In some cases, the neighbors couldn't see my KW; in others, 10 or 20 watts had 'em banging on my door. The above will give you a start, but the ultimate complexity and cost of curative measures may depend on factors out of your control.

Perry,

I have a AEA loop and have used the MFJ one at a friends. The one big
difference is the AEA loop is a much higher quality product.

In addition it has a much larger capacitor than the MFJ does. The plate
spacing is greater because higher voltages are generated. This means the
antenna is higher Q.

If you have questions I would be glad to field them if I can.

Bill

Source record: 217506

I am currently looking for a simple, rugged, reasonably priced 2m mobile. I have narrowed the field down to the following four: Yaesu FT2500, Icom 2000H, Standard C1208A, and Kenwood TM241A. If you have experience with any of the above please share yourimpressions with me. I am a relatively new Ham so please don't assume that I am familiar with the foibles of this particular manufacturer or that. Also, I'm aware that a couple of these radios are pretty new to the market but whatever advise you have to offer would be greatly appreciated.
Thank you,
Chris Grant

From: ekays@promus.com
Message-ID: <3pathg$dr5@stargate.promus.com>
Source record: 217508

Please educate me .....

My Kenwood TS830S has begun to show its age. I've owned it since new
about 15 years now and it's output power has started to sag. It is
time to re-tube this rig.

I have seen (and skipped over) discussions regarding a tube 6146W.
Matched pairs priced at about $50. I seem to remember it was a
more robust version of the 6146B which is the stock tube in my rig.

My questions are :

a) Is this a plug in replacement for the 6146B ?
b) are the voltage current ratings the same ?
c) is $50 a fair price for the pair ?
d) are these really new tubes or NOS ?

Thanks in advance for the information.

I am a collector and preserver of WW-II aircraft
equipment. I rebuild modified units as well.
I pay cash for good items or will work out a trade.
I am not a dealer and do nor resell overseas.

**********WANTED: SCR-274N COMMAND SET EQUIPMENT**********

Looking for:
SCR-274N Components:

A-61-A Dummy Antenna (for transmitter tests)

BC-442 Antenna Relay

BC-450 Remote Control (for 3 receivers)

BC-451 Remote Control (for up to 4 transmitters)

BC-453 Receiver 190-550 Kc

BC-454 Receiver 3.0-6.0 Mc

BC-455 Receiver 6.0-9.1 Mc

BC-456 Modulator

BC-457 Transmitter 4.0-5.3 Mc

BC-458 Transmitter 5.3-7.0 Mc

BC-459 Transmitter 7.0-9.1 Mc

BC-473 Remote Control (for 1 receiver)

BC-496 Remote Control (for 2 receivers)

BC-696 Transmitter 3.0-4.0 Mc

BC-946 Receiver 550 Kc - 1.5 Mc

DM-32 Dynamotor (to power receiver from 28 volts DC)

DM-33 Dynamotor (to power modulator & transmitter from 28v)

FT-220 Mounting Rack (for 3 receivers)

FT-221 Shock Mount (for 3 receivers)

FT-222 Mounting Plate (for 3-receiver remote control box)

FT-225 Shock Mount (for modulator)

FT-226 Mounting Rack (for 2 transmitters)

FT-227 Shock Mount (for 2 transmitters)

FT-228 Mounting Plate (for transmitter control box)

FT-229 Shock Mount (for antenna relay)

FT-230 Adapter (for remote control of receiver, plugs into
lower front of receiver, has only a "pull-type"
handle)

FT-231 Shock Mount (for 1 receiver)

FT-232 Shock Mount (for 1 transmitter)

FT-233 Mounting Rack (for 1 receiver)

FT-234 Mounting Rack (for 1 transmitter)

FT-235 Mounting Plate (for 1-receiver remote control box)

FT-240 Mounting Plate (for 2-receiver remote control box)

FT-260 Adapter (for local control of receiver, plugs into
lower front panel of receiver, has headphone jack,
volume control, and switch.)

FT-262 Shock Mount (for 3 transmitters)

FT-264 Mounting Rack (for 4 receivers)

FT-276 Mounting Rack (for 3 transmitters)

FT-277 Mounting Rack (for 2 receivers)

FT-278 Shock Mount (for 4 receivers)

FT-279 Shock Mount (for 2 receivers)

FT-331 Mounting Rack (for 4 transmitters)

FT-332 Shock Mount (for 4 transmitters)

I-84 Receiver test unit

I-85 Transmitter test unit

MC-211 Right-angle adapter for splined cable

MC-215 Splined cable for receiver remote control (these came
in various lengths from 18" to 13 feet!)

MC-237 Local tuning knob (spinner type) for receiver

(may also carry MC-236 designator or 6743 part nol.)

NOTE: The connectors have two part numbers -- one for the "standard" wiring harness, and one for an open wiring harness. (One has a backshell, the other does not.) The two variants are the basic plug number, and the basic number plus an "A" suffix.

PL-147 Plug, 2-pin, part numbers 6578 or 9127

PL-148 Plug, 3-pin, part numbers 6965 or 9126

PL-151 Plug, 6-pin, part numbers 6784 or 9123

PL-152 Plug, 8-pin, part numbers 6577 or 9125

PL-153 Plug, 18-pin, part numbers 6963 or 9121

PL-154 Plug, 12-pin, part numbers 6964 or 9122

PL-156 Plug, 5-pin, part numbers 6967 or 9124

PL-157 Plug, 2-pin, part numbers 3146 or 7543 (discontinued)

PL-192 Plug, adapter to permit local control of receiver, part number 6787

RC-54 Receiver Test Set (Includes I-84 test unit)

RC-55 Transmitter Test Set (Includes I-85 test unit and A-61-A dummy antenna)

Please contact 72227.1640@compuserve.com
with your list and asking price.

4011. Kenwood 520 & 530

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-16 00:00:00 UTC
From: Lane Kendall <dlk@doar.mhs.compuserve.com>
Message-ID: <3paito$fem@ralph.vnet.net>
Source record: 217581

I have just purchased a Kenwood 530 tranceiver. A friend and fellow ham has a Kenwood 520. After reading the owners manual we find that it gives only enough information on operating the rig to get the final stage tuned without a melt down. It seems to me that there must be thousands of these old radios out there and it seems that someone would have compiled an article (or volume) of tips and tricks for operating these rigs. If anyone could point me in the right direction I would appreciate it.

4016. Japanese Tariffs

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-16 00:00:00 UTC
From: Greenberg@aerospace.aero.org
Message-ID: <Greenberg-160595085852@greenberg-t.aero.org>
Source record: 217586

Hi
Does anyone know if the "to be imposed" tariffs on Japanese autos sold in the U.S. will be applied to other Japanese imports such as ham radio gear? If so, would it be the same as the import autos (100%), or less? Just curious, since much of the equipment we buy is manufactured there. If this tariff does impact ham radio equipment sales, would U.S. or other overseas manufacturers such as Korea or the Phillapines see a boost in production of these and other electronic goods. Perhaps, Radio Shack is on to something with the high quantity of goods they import from these two asian countries. Perhaps, as this msg is going out, companies like Kenwood, Yaesu, Icom, and Standard are setting up shops in other asian countries.

Also, what is to stop American manufacturers of ham gear from hiking their prices if the Japanese prices are going up? If you were an American manufacturer, say TenTec, would you keep the prices of your radios at the current level, or raise them to be closer but a little less than those Japanese goods?

That's capatilism!

73s, de Steve WA6TAF

4017. Tek BNC connectors for Icom HT

Newsgroup: rec.radio.amateur.equipment

From: zateslo@geomag.gly.fsu.edu
Message-ID: <3pakvs$jjl@mailer.fsu.edu>
Source record: 217587

Several years ago, somebody posted information on using Tektronix BNC connectors to replace the original on older Icom HTs. Supposedly, the Tek connector fits fine, and is a very durable connector (important for those of us who abuse our HTs, and frequently plug/unplug things from the antenna connector). There was a Tek part number mentioned in the posting.

If anybody knows the part number, I would be very grateful (the BNC in my IC-32AT is getting flaky).

I own three Kenwood TM-241A rigs and a friend of mind owns two of them.
We purchase all five rigs at a Kenwood-days sale at our local candy store.
Each rig cost us $289.00. If your looking for a bare bones no frills rig,
then the TM-241A is a good contender. One feature I do miss though is an
auto patch phone number memory and a one button dialer.
I had a minor problem with one of the rigs. The display would scramble
periodically. The rig was still under warranty at the time and I took it
to the Kenwood service center in Long Beach, CA. They fixed the rig at no
charge to me in two days. I havent had any problems since.

I hope I have been of assistance to you.

Good Luck! 73

Source record: 217594

At the swap this weekend I acquired a banged-up but working and apparently still reasonably well-calibrated Cushman CE-2 (or was it a CM-2?) FM communications service monitor. This is a generator/monitor with frequency switch-selectable [0-4,9][3-8][0-9] MHz, plus fractional MHz digits. It seems to work fine on 2 meters and 440, I haven't tested the other frequency ranges (I don't even believe in that 900 MHz range) yet.

Of course, I'd like the service and calibration manual, and the operator's manual. Of course Cushman Electronics isn't listed in the Silicon Valley phone book any longer. Can anyone point me to a source of these manuals?

Please reply by e-mail. I'll summarize to the net.

Thanks

Bruce Perens AB6YM

4025. HTX 202 Question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-16 00:00:00 UTC
From: Greenberg@aerospace.aero.org
Message-ID: <Greenberg-160595133503@greenberg-t.aero.org>
Source record: 217595

Hi

Does anyone have any experience using a speaker mic aside of the RS speaker mic for the HTX 202? I've found that the RS mic does not offer very dynamic audio out, & the quality of the transmitted sig appears quite muffled compared to talking directly into the HT.

Tnx & 73, Steve WA6TAF

Yep, Motorola, the only way legally to do it. The software is licensed,
and can not be copied, loaned, etc. Or, take the rig to your local
Motorola Service shop. Motorola is VERY heavy handed if they find anyone
using illegal software, even in the UK......

Yes, I know this wasn't the answer you were looking for.....

I said:
>I've found in many cases that the internal mics in the
>HTX-202 modulate too much at the factory preset. Both myself and a
>friend have had to tweak our radios to get decent sound out of them
>(I'll post instructions on the tweak if anyone's interested).
>
>Methinks you may be accustomed to speaking too far from the mic so
>you won't overmodulate, and the speaker mic might be actually set
>right!

to which Duffy (gamma7@ix.netcom.com) replied

>I think you should be possibly be referring to deviation, not
>modulation.

to which WB6THE (atanner@infi.net) replied

>Remember, folks that there is a subtle, but important difference
>between mic gain and deviation. I'd leave the deviation alone and
>simply adjust the mic gain. de WB6THE

(I hope I got all the attributions right!)

As I understand it, the voltage from the mic causes a certain deviation
of the transmitted signal from center frequency (what I called
"modulation" above, and I think Duffy calls "modulation"). This
deviation/modulation is controlled by two adjustments: mic gain (what
I tweaked) and deviation limit (usually 4.5KHz?, I think this is what
WB6THE was referring to as "deviation"). If the mic gain is
set too high, you hit the limit and your signal is clipped. This was
what I was referring to as "modulating too much". I did actually
adjust the mic gain, as WB6THE suggested.

Maybe I'm just using the wrong terminology?

> I have no idea of brands, models or prices. Help!!

The mountain rescue groups use VHF radios (140 to 160 MHz, 155.16 MHz is the most common). I suggest that 1 to 5 watts is reasonable, but be sure to use full size (1/4 wave) antennas as a minimum, not the rubber ducks. All radio manufacturers make radios of this general type. You did not say what service these radios would be licenced under, this will somewhat dictate the type of radio used. Pricing will probably vary between $300 to $600 depending on brand, features, etc. Licences will be required, no matter what service used.

Message-ID: <3pds1o$j7c@nkosi.well.com>
Source record: 217453

I got sent on a last-minute business trip, and am now in Hong Kong.
In the Causeway Bay area there are about 10 little camera/hi-fi/Icom
dealers, each a small downtown shop. It's wild- they all have
the full range of Icom hand-helds, going back to day one. Each
has older radios, all covered with dust- u2ATs, u4ATs, u3's (Eur. 430?)
and u6's etc. The catch is, they are all priced at the moon- They
are hoping to catch tourists who will pay full price and then some.
As an example, one place quoted me $328 for a dusty H8 (u2 style VHF
comml rig- I'm a "u" series fan. If you look at them funny they may
come down to $200. One guy has pretty good prices- it looks like
real list is the same as US. Also, does anybody know about the H8/U8 series?
Do they use crystals?
Erik

>

The carrier level knob doesn't control (directly) output power on SSB.
The knob you need to adjust for output is the mic level. Tune it up first
as if you were tuning to send cw:

1. Set the meter switch to ALC, the mode switch to TUNE, turn ON the send
switch and peak the ALC reading with the DRIVE control. (Do this for brief
periods of time only). (If there is no ALC reading, increase the carrier
control until there is an ALC reading). Turn off the send switch.

2. Set the meter switch to IP, leave the mode switch at TUNE and turn on
the SEND switch. Quickly adjust the PLATE control to dip the plate current
(minumum reading). Return the switch to REC from SEND.

3. Set the meter switch to RF, the mode switch to CW, and turn on the SEND
switch. Quickly adjust the PLATE and LOAD controls alternately to peak the
power output. Turn off the SEND switch. Do NOT transmit for more than 10
seconds with the finals out of tune - in the CW mode it draws full plate
current. If you have a CW key plugged in, you'll need to key the rig to
tune it.

4. For SSB operation, set the meter switch to ALC, key the transmitter in
LSB or USB and speak into the mic in a normal tone of voice. Adjust the
mic control until voice peaks are just in the top limit of the ALC range
on the meter scale.

This is the normal transmit adjustment process, and should work on any
TS-820.

(If you have a manual, of course you already know this :-))

This should give you a normal SSB signal, about 200 watts PEP.

If you are getting this kind of output, and you can adjust the level of output up and down with the mic knob, I'd say your rig is operating normally. You may also have other interference problems that only show up at certain power levels, but you haven't given us enough information about the interference, what frequencies you're transmitting on, what channels the TV is tuned to , etc to give you much useful info at this point.

I will have to confirm this, as an owner of TWO 5718s. There is no other comparable radio on the market in terms of remote operations and ease of use without taking one's eye off of the road! These are wonderful radios with excellent transmit and receive audio...there is a bit of a learning curve, but basic operations are obvious.

Let me know if you need more info!

Mr. Ferguson is right about the Mountain Rescue teams on 155.160. This is a nationally licensed frequency of the Mountain Rescue Association. Of course, there are other license holders as well. Here in Southern Arizona, we use 155.160 (KJJ439) & 155.220 (WYU875). But we need to send out teams who do nothing bu camp at preselected points to relay out radio traffic.

Amateur Radio is heavily used now. One of our members owns a mountain top repeater site in the 440 band. This provides us with coverage across roughly half the state. But more than that, repeater owners/groups generally welcome and encouage emergency use of their equipment. When needed, we have used 2meter and 220 repeaters. The trick is to know what is available where you are going to be. Get permission from the Control Operator of what ever repeater you wish to use. AND CARRY SPARE BATTERIES! Nothing gets the goat of a Mountain Rescuer like being able to talk directly to the injured/lost/scared person requesting help, and the victim's battery quits! grrrrrrrr....

Have fun out there!
Chris Weddle, N7RME
Member; Southern Arizona Rescue Association, Inc.

>I`d like to hear about good or bad experiences with these radios.

>Any advice gratefully appreciated.

>Serge

Better hurry on the DR600, it is being replaced with the DR610. Some dealers
may have some left.

DR600: Lots of bells and whistles, it has a documentated DTMF decoder
problem, sometimes hard to use, no built in duplexer. Example: I
wanted to use the autodialer memory to bring up local autopatches:
after pushing about 20 buttons, its programmed. Now, to use it, I
have to ONLY push about 10 buttons! Nice remote head feature, easy to read
display. Feels cheaply made. One distributor I work with claimed a very high
return rate during the last couple of months. I have one I will be selling,
hoping to get the 610.

FT5100: Simplestic front panel, lots of functions accessed by
function key depressions (short, long, etc). Built in duplexer, nice
illuminated keys on mic, gets hot during use, typical ham radio quality (not
great, not bad), havent heard of any having serious problems.

Cheers,
Tracy

>| |
>==

This is not the antenna on the Alinco. That antenna has a rigid bottom
portion, about 2" long, then the rubber antenna sticks out from that about 3".
The Maldol is 3" total length, and extremely flexible. Very popular.

Just as an additional comment, a customer came in with an Alinco DJ580. On a
uhf repeater of about S3, we tried a Genesys B27 replacement duck, and his
signal level went to S9. This is not an isolated case, the stock Alinco duck
is not very good.

You might have a look at the new NIR-12 from JPS Communications. It has dual DSPs and two different types of voice noise reduction which can be used alone or together. Also tunable bandpass filtering and automatic notch filtering. Internal access is provided to the DSPs for adventuresome folks who want to develop their own software. You can email jps@nando.net for more info.

I'm not familiar with the 820, but this sounds like a job for ALC. You might check to see if there's an easily accessible adjustment that would allow turning down the power. This should alleviate the difficulties with mic distance.

>
>Tnx & 73, Steve WA6TAF

I've found in many cases that the internal mics in the
HTX-202 modulate too much at the factory preset. Both myself and a
friend have had to tweak our radios to get decent sound out of them
(I'll post instructions on the tweak if anyone's interested).

Methinks you may be accustomed to speaking too far from the mic so
you won't overmodulate, and the speaker mic might be actually set
right!

Message-ID: <3pc9pp$18r@helios.intranet.gr>
Source record: 217516

: Is there anything special about Kenwood's interface for RS232 to
: do remote control on a TS850S?
: Looking over the pinout, the standard serial lines are all there,
: is it just a cable/connector situation? Or is adapting those serial lines
: on the rig necessary (to bring them to RS232 level)?
: Is there a FAQ/info sheet on this maybe?

: Just wondering -- so I don't have to spend the $ on the actual
: McCoy if I have to..

What the Kenwood IF232 interface does is isolates the RS232 from your
rig and brings the rig signals to RS232 level...
The isolation is done by optoelectronic methods. There are cheaper
versions of this interface made by different manufacturers such as
MFJ, but the isolation is not there...
The choise is yours, but in most cases what you pay is what you get...

73's

PS No matter which way you go, don't forget to run Amazing Kenwood Version
4.0 (ak40.zip available at any SimTel site) to control your rig.

From: jeffk@p51.corp.sgi.com (Jeffrey Komori)
Subject: ACC DVR Digital Voice Recorder

I just bought (used) an Advanced Computer Controls Digital Voice Recorder (ACC DVR).
While looking through the manual, it says that while the board layout only accepts 64K or
256K
DRAM chips for a total of 1 MB, the hardware and software addressing capabilities can go
all
the way up to 8 MB.

I was wondering if anyone has modified their ACC DVR to accept maybe an 8 MB SIMM or
other such to max out the memory for more recording time? I'd be very interested in hearing
how to do this.

: and upgrades, also inexpensive, come about once a year. Support for
: questions or problems is excellent

: 73
: Ron WB4RUO

I agree LOG-EQF is quite good. But then there is Ham Log 3.1 by VK2VN which
is professional and reviewed as...

On version two, Len Shaw editor of Amateur Radio Action wrote:
"The author has gone considerably further (on features) than
in any log program... ...you are unlikely to find a better
log-keeping program anywhere. Having seen and used a wide variety
of shareware and commercial programs, I believe this one to be
excellent value for money... I would say the same if it was
double the cost." On v.2.4: "The Best Gets Better".

In France's Megahertz: "Installation: Easy! ...neat professional
which remains simple to use".

On version 2.5 The Canadian Amateur magazine wrote:
"This is the first program I have used in years that I really
cannot find anything to improve on."

Now, there is version 3.1 of Ham Log. (Functioning version
available on the Internet - HAMLOG3.ZIP at oak.oakland.edu) Give
it a go, you will be pleasantly surprised.

Aside from tubes, the most frequent component to fail will be the
electrolytic capacitors. They tend to get leaky, or open, with age.
Aside from that, the other problem you'll face is worn/corroded
switches and noisy pots.

Subject: old rig

kc7fqd@primenet.com (Dennis Rice) is thinking of buying an old SB-102 (old? I can remember when it was new) and was wondering what common things might be wrong with it, other than the tubes going bad.

gary@ke4zv.atl.ga.us (Gary Coffman) responded, mentioning bad electrolytics and switches with dirty contacts and noisy pots.

That made me want to add one imortant point. An old rig suffers because it uses tubes, and tubes are not as common as they once were. But those old rigs have a benefit; they are much simpler than the rigs of today. You might have to do some work to get an old rig going, or to get it up to snuff, but it is a whole lot easier than trying to fix up a rig of today. Things were not as compact, the parts were all standard, and there weren't the bells and whistles of today's rigs to add complications to trou
bleshooting.

One thing that keeps people from trying to fix their own equipment must surely be the fear of doing damage, and the fear that it is hard to work on. An older rig, where you probably won't pay too much for and which is not microminiaturized, provides a chance to give repair

a chance.

Subject: Para Dynamics PDC9 SWR/PWR meter?

I purchased a Para Dynamics PDC9 SWR/PWR meter at the
Dayton Hamvention. It is the VHF/UHF model which has
two power ranges: 15W and 60W. Well, it seems to have
a problem measuring reflected power. I'm not getting
any reflected power at all no matter what antenna
I hook up to. My guess is that one of the detector
diodes is blown or defective. I've opened the unit up,
and everything looks nominal to the naked eye.

Problem is, there is no address for Para Dynamics anywhere
on the package or on the sheet of instructions. The
only clue is a "Made in Korea" on the back of the package
next to the specs. Does anyone know how I can contact
this manufacturer?

Please respond by E-mail, as my net access is by long-distance
land line, and I don't get on here too often.

From: Philip Peake <philip@ucsd.edu>
Subject: Why should we not post commercial items

This doesn't really belong here - but since you asked ...

I hope you like history, because that is what you are going to get, a history
lesson on the evolution of The Information Superhighway.

The original USENET mainly consisted of various sites connected via telephone
lines and modems, usually 1200 baud (or 2400 if you were seriously rich).

This was a sort of private network (although anyone who wanted to join was
more than welcome to do so). Since it was "private", and the participants
paid all of the (significant !) communication costs, they could also excersize
some control over what was passed. The only real limitations imposed were
on commercial traffic (esp. advertising, after all would you appreciate some
commercial enterprise using your 'phone bill to do their advertizing ?).

As USENET evolved, some sites, especially universities, who found it difficult
to justify tens of thousands of dollars 'phone bills, began to use other means
of communication; ARPAnet, and later NSFnet/Internet. These networks are/were
publicly funded (mainly DoD funded). As such, they had restrictions imposed
upon their use.

So you began to see people post relatively harmless, but nevertheless
commerical
items, and howls of rage would come from those people who had decided that the
American taxpayer was going to pay their communication bills. Forget the fact
that using these networks to carry private e-mail and USENET newsgroups was
probaly a direct infringement of the conditions of use of these networks, the
mere thought of anything blatantly commercial being carried, and maybe even
noticed by someone, caused the people using these networks sleepless nights.

In much of the rest of the world, and, yes, there is life outside the shores of
America, networks were mainly run as semi-private ventures (e.g. EUnet), and

no-one would get into any sort of legal trouble for commercial use, but there was (and is) a general feeling that, running the networks was expensive enough, without commercial users filling it with junk mail, degrading performance and raising costs.

In some countries, the private networks would have had problems with telecoms authorities, if they thought that they might be losing revenue by someone using a private network rather than paying through the nose for the government provided "service".

These days, much of "the InterNet" (or SUPERHIGWAY or whatever buzz phrase you want to use) is actually carried on commercial networks, and there really isn't any legal, moral or ethical restriction on commercial traffic.

However, as you peruse these newsgroups, you can't help but notice that it is already difficult enough to extract the usefull and interesting data from the random babbling of the the majority. There really *are* people who look to many of the newsgroups (like this one) for real, usefull information. If the content to babble ratio were further reduced by the introduction of significant amounts of commercial traffic these groups would lose their reason for existence.

If you want to do commercial type things, can I suggest that you take a look at the World Wide Web ? it is much better adapted to that sort of use.

Philip

Subject: Re: New Yaseu Repeaters (Vertex)

Synthesized repeaters could be adapted to a trunking
system - dynamic allocation of repeater frequencies,
should amateurs ever decide to adopt such a system.

There has been some discussion of this in recent QST.

: This is a warning to any and all fellow hams considering the purchase of a
: Kenwood with a removeable face. This may apply to other manufacturers, too
: Kenwood DOES NOT SELL THE FACEPLACE SEPARATELY. When I had mine stolen I h
: to go through an awful time, and ended up buying a whole new radio (Kenwood
: again...mistake) and keeping my old xcvr as a spare parts box.

: There is something wrong with buying a ham radio from a company which also
: sells bread makers, cd players and rice cookers.

I agree with you that not being able to buy only the face plate of your
rig really sucks, and that Kenwood must change this bad marketing position,
but I can't agree with your last comment...
Kenwood is not any less better (one of the best in my opinion)
in manufacturing Ham Radios because they also make rice cookers !
Yamaha is known because their motorcycles are among the best in the world,
but they also make one of the best consert pianos money can buy...
Making motorcycles and pianos does not make Yamaha any less reliable
in one or the other field...

Did you try to contact Kenwood directly in Japan ?? I have found
their customer service very helpfull...

I've bought from W&W for a variety of radios. So far quite pleased. Their
prices seem to be less for some applications, the same for others. The FT530
uses the FNB25/26/27 series. W&W sells these from $35 to $49, with various
models from 7.3v/600mah to 12v/800mah. They have a 7.2v/1500mah as well. I'm
not at all brand-loyal 'tho, the moment somebody offers a better deal....

Subject: Drake TR3

The TR-3 with mobile supply, if in good shape,
(no drilling holes in the case, case not repainted,
face not badly scratched, all original knobs, no modifications)
is worth about $225-250. Goes down from there, and many
have been sold complete for under $200.

The TR-4/C/CW is much more popular and goes for $300-350
depending on condition.

Best of luck ES 73 AB5S/7 Dave in Lost Wages, Nevada

Brian Comer of Comer Communications will be the guest this Sunday
on the Ham Radio & More show at 6:00pm ET on the Talk America Radio
Network. Brian's company manufactures a full DSP hf transceiver with
2m, 6m, 220, 440 adapters. The software is free to run it and is totally
incredible. Will soon do Amtor, Packet, Pactor, RTTY, and more, all at
no extra charge.
Be sure to listen to this Sunday's show.

I have seen advert here in NZ for SoftWave by ComFocus - looks very complete
vhf to hf, built in scope for spectum analyser etc world map , and just
about all you can think of.
It's a card in the pc and a plain box outside.
Think but don't know it's about NZ$3,000

From: patm@engr.st.3com.com (Patrick Mullaney)
Subject: IC-730 Market Value?

Hi.

I am looking into purchasing an IC-730 from a local ham. The
radio is in real nice shape, and I know the owner takes good care
of his equiment. The only thing I, and the owner, don't know about
the radio is it's fair market value.

So, If anyone has purchased or sold an IC-730 lately, I am interested
in hearing the price.

Any feedback would be appreciated...

Subject: ICOM 731 Tuning Problem

I have a friend with an Icom 737 that has a problem with the tuner, it
works fine until you try to tune in say 15000 then it's totally useless,
no receive or transmit until you get to say 15050 or so. I'm told that
this is a common problem and the fix is easy. If any knows what this fix
is, can you please e-mail it to me. Thanks :)

From: "A.J. Whitney" <aw20+@andrew.cmu.edu>
Subject: Recommendations For Two-way Radios

Please excuse me if this is not the appropriate place to post this message.

I am looking for a pair of good quality two-way radios with headsets
with at least a couple mile range. I know Motorola generally makes good
radio equipment so that's kinda what I'm looking at currently. A single
channel is probably sufficient (although the more the merrier). I will
need voice-activated (with switchable push-to-talk capability for really
noisy conditions) headsets for both that work well in windy conditions.
I know a couple of ski resorts that use setups similar to this for ski
patrol. Does anyone have a suggestion as to a particular model (or
brand other than Motorola)? Is there a mail-order supplier that handles
this sort of equipment (there seems to be for most other electronics)?
Phone numbers would be very helpful here. Also, what about chest or
back-pack style velcro-closure accesories for holding the radios
(standard belt-mounted holsters aren't going to work for this).

Oh an in case you are wondering...we will be using these for
communication during extended biking trips (and probably other stuff
too). Maybe this will help with suggestions (ie. headsets that easily
fit under bike helmets would be a plus). We would prefer to spend a
little more and end up with long-lasting quality equipment (if that
helps with suggestions).

Thanks.

Subject: S-38 BFO

Michael Black (Michael.Black@juxta.mba.org) wrote:
: Visor@globalcom.net brings up the point that he remembers that the S38 did not have a BFO, but provided a beat by putting the IF into oscillation.
:
: I think he's right. I recall seeing things about this; I seem to recall seeing at least one article on upgrading the S38, and it included adding a separate BFO.
:
: But if I am remembering this right, then I also remember that the S38A did add a separate BFO, for what it's worth.
:
The original S38, the one I have, has a separate BFO stage. It is a SIX tube radio as opposed to the american five. the output stage is a 35L6 instead of a 50L6. There is a BFO control on the front panel. Later versions did not have one. The date on the manual for my radio is "August, 1946."

The complete tube complement for the S38 (no suffix) is:

12SA7 Mixer-Oscillator
12SK7 IF amplifier
12SQ7 Detector-1st audio-AVC
12SQ7 BFO-Noise limiter (yes, there is a noise limiter switch on the FP)
35L6 Audio output
35Z5 Rectifier
